

Chapter 7

Hypothesis and Research Questions

2023

FIGURE 2.1

Hypothetical representation of factors affecting infant birth weight.

A hypothesis:

- States an expectation, a predicted answer to the research question
- Should almost always involve two or more variables
- Suggests the predicted relationship between the independent variable and the dependent variable.
- “tentative prediction or explanation of the relationship between two or more variables”
- Always written before the study, should not be changed after the study results are examined

Purpose of hypothesis

- Provide objectivity
- The theoretical proposition can be tested in the real world.
- Guide the research design.
- Direct the statistical analysis.

Source and rational of hypothesis

- Personal experience
- Observation
- Previous literature
- Theory

Classification of hypothesis

1. Simple and complex

Simple

- State a relationship between one independent variable and one dependent variable.

Complex

- State a relationship between two or more independent variables, two or more dependent variables are being examined in the same study

Example of a simple hypothesis:

Patients receiving a warmed solution for body cavity irrigation during surgical procedures [X] will maintain a higher core body temperature [Y] than patients receiving a room temperature solution (Kelly, Doughty, Hasselbeck, & Vacchiano, 2000).

A.

x → y

Example of a complex hypothesis—multiple independent variables:

Among breast cancer survivors, emotional well-being [Y] is influenced by the women's self-esteem [X_1], their resourcefulness [X_2] and their degree of social support [X_3] (Dirksen, 2000).

Example of a complex hypothesis—multiple dependent variables:

The implementation of an evidence-based protocol for urinary incontinence [X] will result in decreased frequency of urinary incontinence episodes (Y_1), decreased urine loss per episode [Y_2], and decreased avoidance of activities [Y_3] among women in ambulatory care settings (Sampselle et al., 2000).

Classification of hypothesis

2. Directional and Non-Directional

• Directional

- Prediction of the type of relationship between variable
- “More than”
- “Less than”
- “Decrease”

• Non directional

- Prediction that a relationship exists

Classification of Hypothesis

3. Null and Research Hypothesis

- **Null or statistical Hypothesis (H₀).**

- Predict that there is no relationship presents between variables.
- Null hypothesis subjected to statistical analysis.
- The aim of researcher to reject null hypothesis

- **Research or alternative hypothesis. (H₁).**

- States the expected relationship between variables.

← least suitable candidates

→ most suitable candidates

95% of the population lie between -2 and +2 standard deviations
68% of the population lie between -1 and +1 standard deviations
31% of the population lie between -.5 and +.5 standard deviations

criteria to be considered when formulating a hypothesis

A hypothesis should:

- be written in a declarative sentence
- be written in the present tense
- Hypotheses are tested in the present
- specify the population to be studied
- reflect the problem statement or the purpose statement
- contain all the variables
- be empirically testable
- Ethical and value issues are not empirically testable and must be avoided.

Hypothesis testing

Examples

Hypotheses

(1) Subjects receiving antiemetic therapy by a patient-controlled pump will report less nausea than subjects receiving the therapy by nurse administration; (2) subjects receiving antiemetic therapy by a patient-controlled pump will vomit less than subjects receiving the therapy by nurse administration; (3) subjects receiving antiemetic therapy by a patient-controlled pump will consume less medication than subjects receiving the therapy by nurse administration.

Examples

- Elderly patients who are praised (reinforced) by nursing personnel for self-feeding require less assistance in feeding than patients who are not praised.
- Pediatric patients who are given a reward (e.g., a balloon or permission to watch television) when they cooperate during nursing procedures tend to be more obliging during those procedures than nonrewarded peers.

Examples

Pregnant women who receive prenatal instruction regarding postpartum experiences are not likely to experience postpartum depression.

Hypothesis Examples.

Nieswiadomy

• Birth weight is lower among infants of alcoholic mothers than among infants of nonalcoholic mothers.

• The greater the degree of sleep deprivation, the higher the anxiety level of the ICU patients

Hypothesis exercise

• Daily weight loss is greater for adults who follow a reduced calorie diet and exercise daily than those who do not follow a reduced calorie diet and do not exercise daily

• The level of job mobility is different for psychiatric nurse than for medical surgical nurse.

Hypothesis exercise

- **More postpartum depression and feeling of inadequacy are reported by women who give birth by caesarean delivery than by those who deliver normally.**

- **There is a negative relationship between denial and reports of anxiety among post myocardial infarction patients.**

Example

- Problem statement: is there a change in the anxiety level of preoperative patient after listening to relaxation tape?
- Hypothesis: there is a change in the anxiety level of preoperative patients after listening to a relaxation tape.
- Preoperative anxiety level will decrease after listening to relaxation tape.

Hypothesis criteria

- Written in declarative sentence
- Written in the present tense
- Contains the population
- Contains the variables
- Reflect the problem statement
- Is empirically testable.

Find the independent and dependent variables

- Male appendectomy patients request more pain medication on the first postoperative day than do female appendectomy patients
- There is a relationship between the number of prenatal classes attended by pregnant women and their degree of fear concerning labor and delivery

Find the independent and dependent variables

- The infants born to heroin addicted mothers have lower birth weight than infants of non addicted mothers.
- There is a relationship between tactile and auditory stimulation and heart rate response in premature infants.
- Older nurses are less likely to express approval of the expanding role of nurses than younger nurses.
