

# VSD

<b>Position</b>	<b>Pressure (mm Hg)</b>	<b>Oxygen Saturation (%)</b>
SVC	Mean = 6	75
RA	Mean = 6	75
IVC		78
RV	80/0, 12	80
PA	80/40, mean = 55	80
PCW	Mean = 5	95
FA	80/54, mean = 62	95

SVC, superior vena cava; RA, right atrium; IVC, inferior vena cava; RV, right ventricle; PA, pulmonary artery; PCW, pulmonary capillary wedge; FA, femoral artery.

# How much $Q_p$ ? How much $Q_s$ ?

$$Q_p/Q_s = \frac{\text{Aorta} - \text{mixed venous}}{\text{Pulmonary vein} - \text{pulmonary artery}}$$

$$Q_p/Q_s = 95\% - 75\% / 95\% - 80\% = 20/15$$

A. 1.33

B. 1.50

C. 1.75

D. 2.00

E. 2.25

Position	Pressure (mm Hg)	Oxygen Saturation (%)
SVC	Mean = 6	75
RA	Mean = 6	75
IVC		78
RV	80/0,12	80
PA	80/40, mean = 55	80
PCW	Mean = 5	—
FA	80/54, mean = 62	95

SVC, superior vena cava; RA, right atrium; IVC, inferior vena cava; RV, right ventricle; PA, pulmonary artery; PCW, pulmonary capillary wedge; FA, femoral artery.

# The patient then receives 100% oxygen therapy

<b>Position</b>	<b>Pressure (mm Hg)</b>	<b>Oxygen Saturation (%)</b>
SVC	Mean = 6	85
RA	Mean = 6	85
RV	80/0, 12	—
PA	80/30, mean = 50	95
PCW	Mean = 5	—
FA	80/54, mean = 62	100

Note: FA blood gas = 7.44, pCO<sub>2</sub> = 37 torr, pO<sub>2</sub> = 525 torr.

How much is the Qp:Qs now?

A. 5.0

B. 4.2

C. 3.7

D. 3.1

E. 2.9

$$Q_p/Q_s = \frac{\text{Aorta} - \text{mixed venous}}{\text{Pulmonary vein} - \text{pulmonary artery}}$$

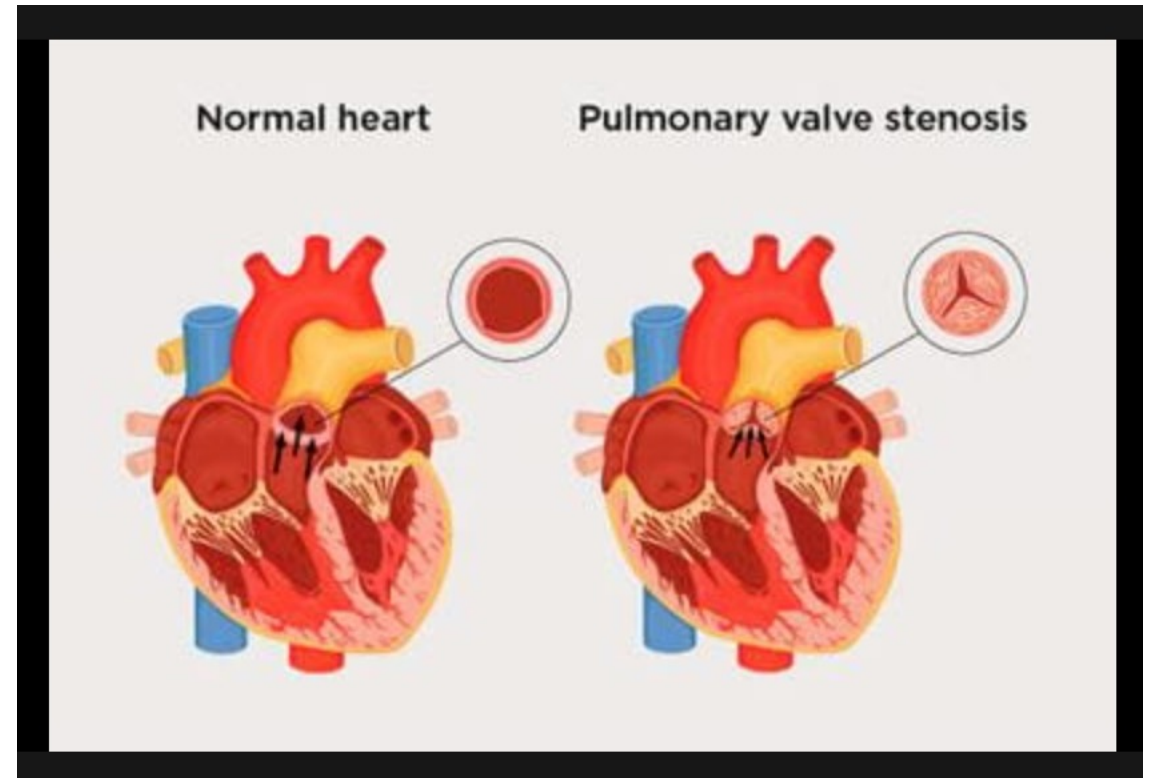

# What is it wrong?

Position	Pressure (mm Hg)
RA	Mean = 5
RV	60/8
MPA	60/8
PCWP	Mean = 20
LV	120/24

Severe pulmonary regurgitation !

RA, right atrium; RV, right ventricle; MPA, main pulmonary artery; PCWP, pulmonary capillary wedge pressure; LV, left ventricle.

# What I am looking at?

# And when it does not make sense?

SVC: 72% / RA: 85% / RV: 83%

MPA=83% / RPA=84% / LPA=85%

LA=92% / **RPV=99% / LPV=83%**

# Severe cyanotic disease

# Major aortopulmonary collaterals

# If the heart has no room

If the heart  
has no room

# Find the difference

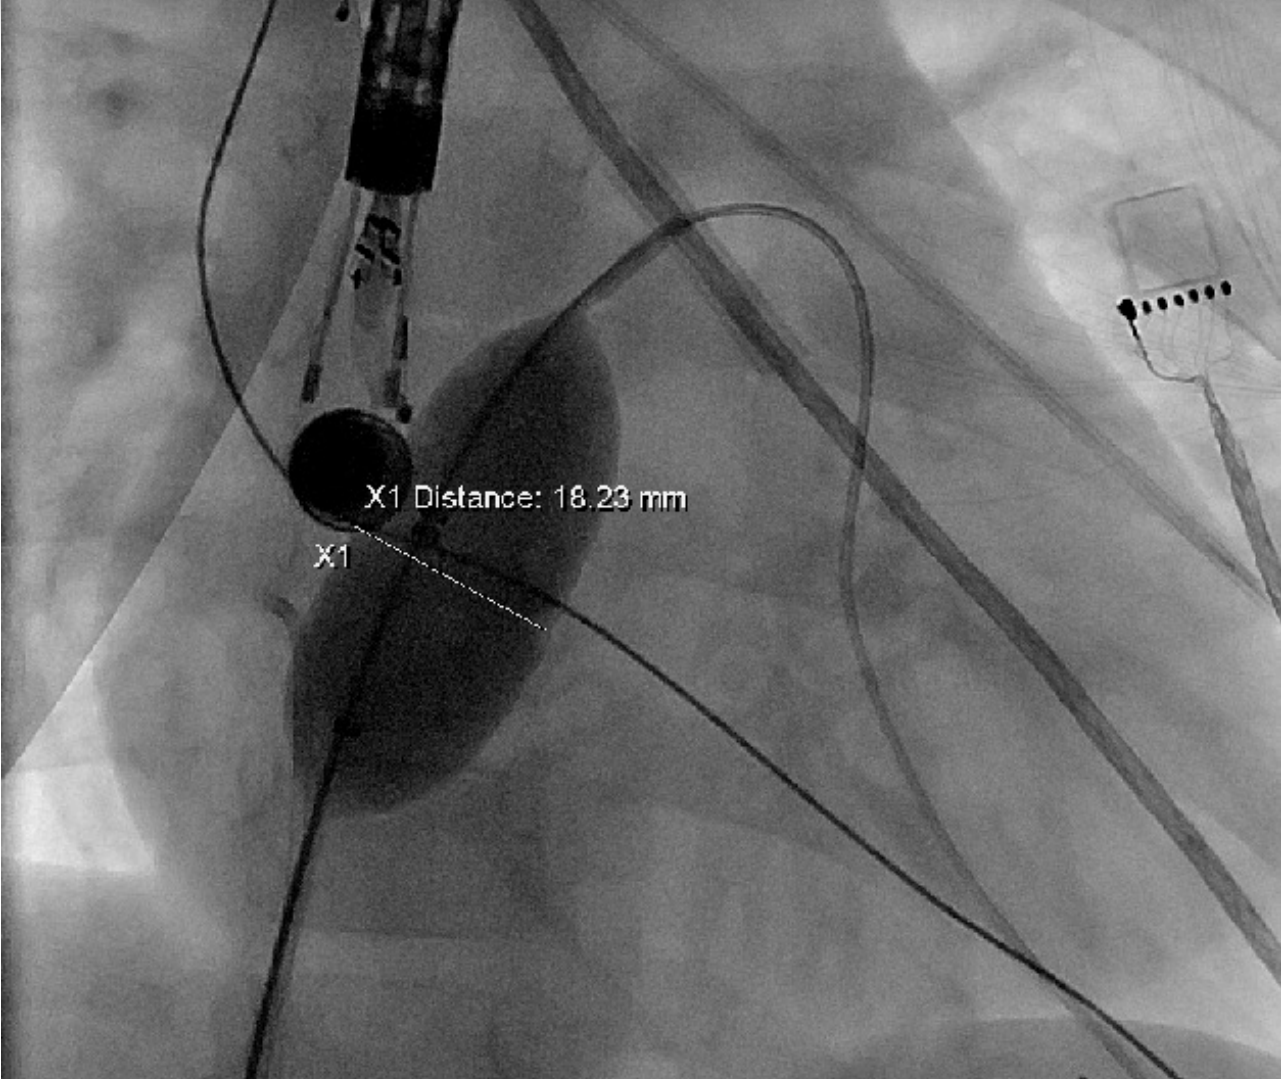

# ASD

# ASD closure

A very narrow aorta

[L] [A]

[P]

X1 Distance: 11.94 mm  
X2 Distance: 12.18 mm  
X3 Distance: 3.97 mm  
X4 Distance: 81.88 mm

[L] [A]

X1 Distance: 3.85 mm  
X2 Distance: 10.62 mm  
X3 Distance: 9.14 mm  
X4 Distance: 10.28 mm  
X5 Distance: 1.03 mm  
X6 Distance: 47.43 mm

[L] [A]

# A very unusual case

Female term new-born (2.7kg)

- Uncomplicated pregnancy
- Urgent caesarean section for foetal bradycardia
- Normal Apgar-scores and umbilical artery pH

Severe cardiogenic shock at 4-hours of life

# ECHOCARDIOGRAPHY

- Structurally normal heart
  - Severe biventricular systolic dysfunction
  - **Despite** persistent ductus arteriosus (PDA)
  - Thrombotic structure at LMCA ostium
- Placement of peripheral VA-ECMO in the cath lab

# INTERVENTION

- Selective coronarography with a 4.2 JR catheter
- Complete thrombotic LMCA occlusion

# INTERVENTION

- Intracoronary thrombolysis (Actilyse®, Altéplase 0.1mg/kg<sup>1</sup> over a few minutes)
- 0.014” HI-TORQUE PILOT™ guidewire followed by a PROGREAT® Microcatheter were advanced in the LMCA

→ Minimal left coronary flow was re-established

1. El-Sabrou H, Ganta S, Guyon P, Ratnayaka K, Vaughn G, Perry J, Kimball A, Ryan J, Thornburg CD, Tucker S, Mo J, Hegde S, Nigro J, El-Said H. Neonatal Myocardial Infarction: A Proposed Algorithm for Coronary Arterial Thrombus Management. *Circ Cardiovasc Interv.* 2022 May;15(5):e011664. doi: 10.1161/CIRCINTERVENTIONS.121.011664. Epub 2022 Apr 29. PMID: 35485231.

# INTERVENTION

- After subsequent intracoronary thrombolysis, LCA flow was restored
- Residual peripheral thrombus in the mid LAD

# INTERVENTION II

- Insufficient systemic perfusion on VA-ECMO due to recirculation via PDA
- 12-h later transcatheter retrograde PDA-closure with an Amplatzer™ Duct Occluder II (5x4mm)

# WHAT NEXT?

- Troponin-T levels gradually dropped from 220'000ng/L to 700ng/L
- Echo demonstrated steady improvement in LV function with patent LMCA/LAD under Adrenalin, Levosimendan, and VA-ECMO support
- BUT unsuccessful VA-ECMO weaning after 3-weeks
- Autoptic findings showed pervious coronary arteries

# CONCLUSIONS

- Acute myocardial infarction in structurally normal heart is a very rare cause of neonatal cardiogenic shock
- It has a high mortality rate
- In this case, paradoxical embolization from the placenta was postulated due to perinatal manifestation in absence of other risk-factors
- After stabilisation on VA-ECMO, early intracoronary thrombolysis should be considered as rescue strategy
