

### Introduction

AH401, designed with Bipolar technology, includes on-chip Hall element voltage generator, a voltage regulator for operation with supply voltages of 3.8 to 60V, reverse voltage protection, temperature compensation circuitry, small-signal amplifier, Schmitt trigger and an open-collector output.

The sensor is designed to respond to North and South poles. While the magnetic flux density(B) is larger than operate point B<sub>op</sub>, the output will be turned on with low output level. Then the output is held until the magnetic flux (B) is lower than release point B<sub>rp</sub>. The output will be turned off with high output level.

AH401 offers a variety of packages, including TO-92, SOT-23. All packages are RoHS compliant.

### Absolute Maximum Ratings

The absolute maximum value is the limiting value when the chip is applied, above which the chip can be damaged. Although the function of the chip is not necessarily damaged when the absolute maximum value is exceeded, the reliability of the chip may be affected if the absolute maximum value is exceeded for a certain time.
