

NonStop Identity Management Server (NIMS)

CSP's NonStop Identity Management Server (NIMS) is an exciting product which brings the benefits of LDAP based Enterprise Identity Management to the HP NonStop platform.

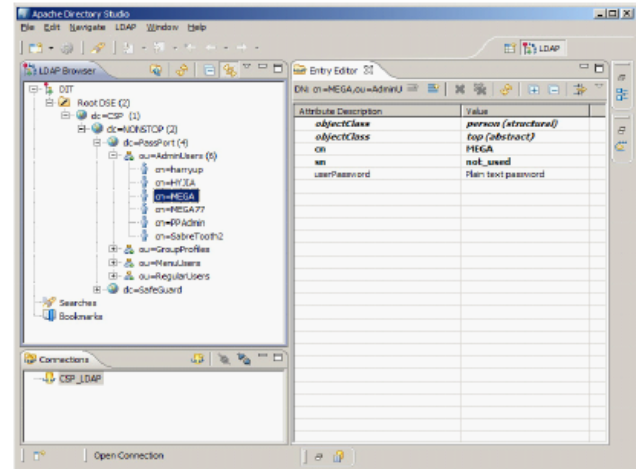

Identity Management is the ability to manage user credentials and system access across the IT infrastructure. This is usually accomplished by managing the full lifecycle of user activity from a central directory. With CSP NIMS, HP NonStop Servers can now be part of the corporate identity management system.

Key Features

- Full OpenLDAP compliance
- Compatible with CSP's Protect XP® and CSP PassPort® security products
- Connects to LDAP clients such as Apache Studio, RadiantOne and Tivoli Identity Manager
- Changes LDAP requests into Safeguard user changes via Protect XP or CSP PassPort
- Authentication and Access Control for all NonStop user IDs
- Full auditing and reporting of changes made

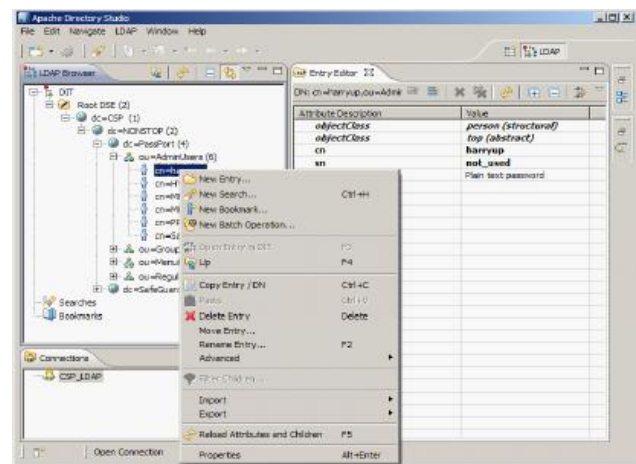

Client Interface

CSP NIMS is fully compatible with any LDAP compliant interface. Shown using the Apache Studio browser, CSP NIMS supports the browsing of User IDs on HP NonStop Servers.

Easily browse users on HP NonStop Servers

With CSP NIMS, administrators can easily add, alter or delete user attributes with a few clicks of the mouse. Single or multiple users' attributes can be changed at the same time. Multiple sessions are supported so that many users on multiple HP NonStop nodes can be managed as one entity. Changes can be made in real time, or stored in a script file for later execution.

User ID attributes can be added, changed, or deleted for one or multiple users at the same time

[continued overleaf]

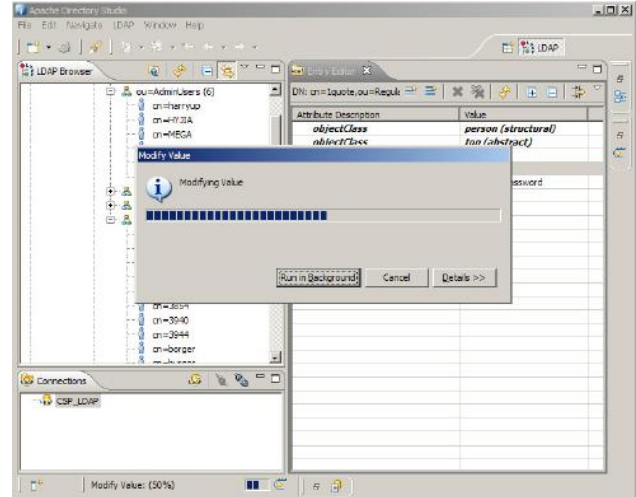

Benefits

Identity management using the LDAP protocol enables the use of a central directory containing all user identity information. Significant cost savings are achieved by the removal of redundant manual tasks on multiple repositories.

With CSP NIMS you can ensure that users have access to the resources they require to get the job done and nothing more. In addition, orphan User IDs (ones where the owner of the ID have left the organization) can be easily identified and removed.

With support for both Safeguard users (through Protect XP) and CSP PassPort users, CSP NIMS will automatically create audit events when User IDs or their attributes are changed. Complete audit reporting of events is available, including the export of audit information to other platforms for later analysis.

And CSP's Alert-Plus® product, part of the Protect XP Suite, has the capability to create alerts, EMS events, and emails based on audited CSP NIMS actions.

User ID changes can be applied in real-time or saved to a script file for delayed execution

Enterprise Security Management

CSP NIMS easily integrates HP NonStop Server into mainstream Enterprise Security Management.

Let us show you how CSP NIMS can connect your HP NonStop Servers to a central Identity Management solution.
