Coatings with Petrous beauty

GRANULOMETRIES

Mineral particle size influences texture and strength. The greater the thickness, the greater the roughness and hardness. Coarser granulometries can be used as a base and finish, while finer ones are for finishing only.

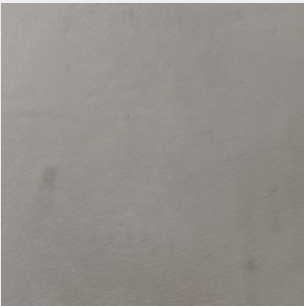

The samples in the chart represent the maximum roughness before sanding, so they do not show the final finish, but a tactile and visual reference of each texture.

The high quality of our minerals is reflected in the uniformity of the grain size. Through the selection of the best quarries, the particle size maintains a minimum variation, ensuring a high-end finish.

El tamaño de mineral influye en la textura y resistencia. A mayor grosor, mayor rugosidad y dureza. Las granulometrías más gruesas pueden usarse como base y acabado, mientras que las más finas son solo para acabado.

Las muestras representan la rugosidad máxima antes del lijado, por lo que no muestran el acabado final, sino una referencia táctil y visual de cada textura.

La alta calidad de nuestros minerales se refleja en la uniformidad de la granulometría. Gracias a la selección de las mejores canteras, el tamaño del mineral mantiene una variación mínima, asegurando un acabado de alta gama.

Use this color chart as a guide. The samples are made with Microne fine. The color may vary according to the type of mortar and the granulometry used.

Utilice esta carta de color como guía orientativa. Las muestras están realizadas con Microne Fino. El color puede variar según el tipo de mortero y la granulometría utilizada.
