

Medical Genetics and Genomics

2023

Pr Ouldim Karim
Médecin généticien
Professeur de Génétique Médicale
et d'oncogénétique

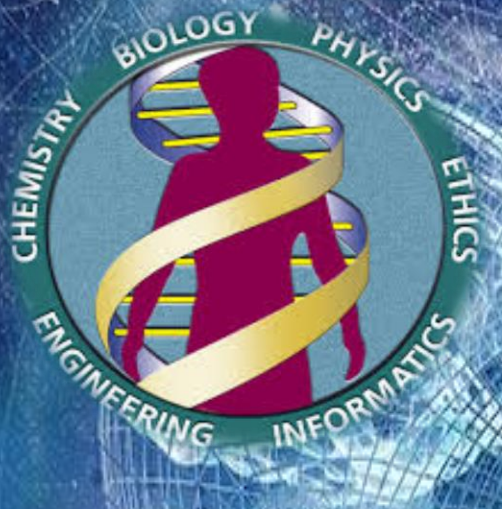
Cours de Génétique Médicale

1ère année médecin 2023 / 2024

Faculté de médecine et de Pharmacie d'Errachidia

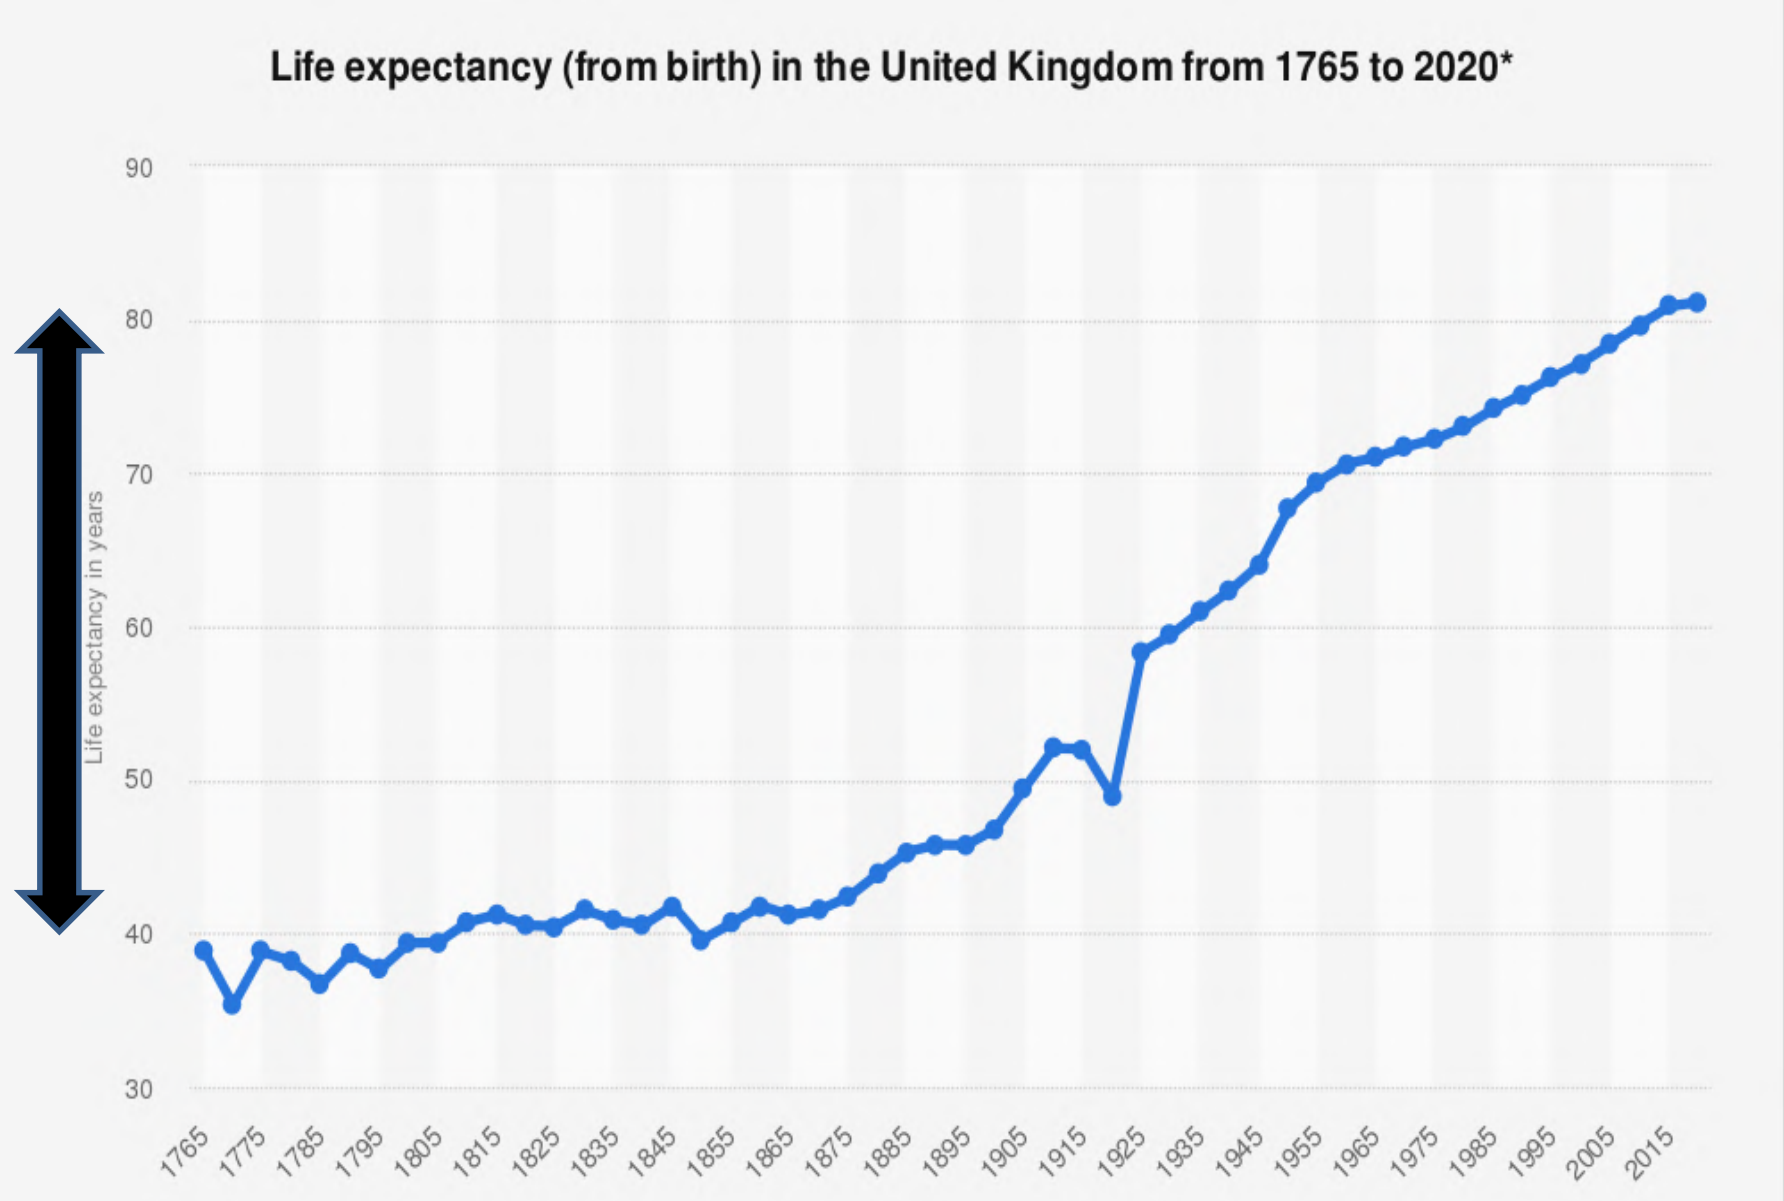
1. Les acides nucléiques et Génome Humain
2. Réplication et systèmes de réparation de l'ADN
3. Transcription
4. Traduction
5. Contrôle de l'expression génique
6. Cytogénétique classique et moléculaire
7. Types et mécanismes des anomalies chromosomiques
8. Techniques d'analyse de l'ADN
9. Mutations et leurs conséquences en pathologie humaine
10. Mode de transmission des Maladies héréditaires

Medical Genetics & Personalized *Medicine*



Precision medicine (PM) has been defined as an approach that uses a person's genetics, environment, and lifestyle to help determine the best approach to prevent or treat disease

Biotechnology Research & Innovation



Precision medicine (PM)

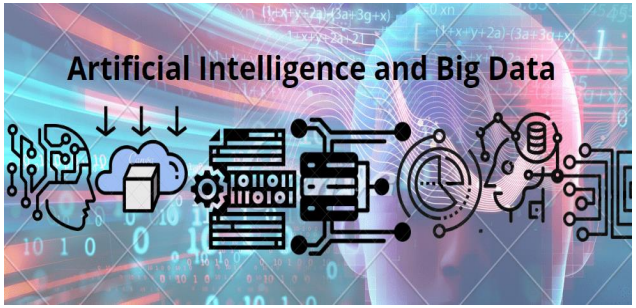
Precision medicine

Precision medicine promises improved health by accounting for individual variability in genes, environment, and lifestyle.

Precision medicine will continue to transform healthcare in the coming decade as it expands in key areas:

Huge cohorts

Big Data
Artificial intelligence (AI)



Routine clinical genomics

Phenomics and environment

Joshua C Denny 1, Francis S Collins 2 Precision medicine in 2030-seven ways to transform healthcare 2021 Mar 18;184(6):1415-1419.

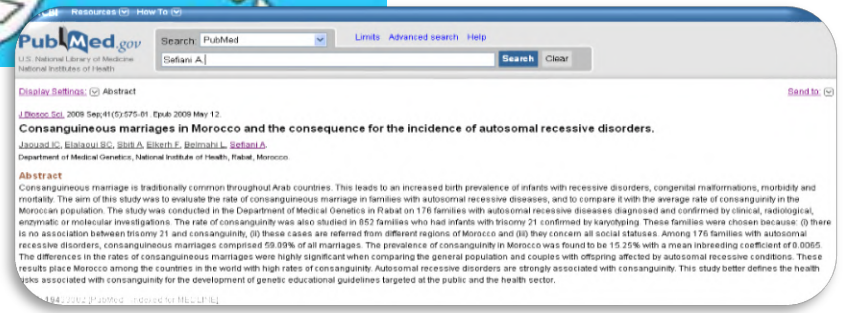
CONSANGUINEOUS MARRIAGES IN MOROCCO

Morocco : **Mediterranean countries**



-). Consanguineous marriages are **culturally favoured**.
- The practice is frequent in all Moroccan populations, **which are grouped according to cultural or linguistic differences**; it is the result of a mixing of Arabs who speak Arabic and non-Arabs (northern–central Berbers who speak Tarifit and southern Moroccan Berbers who speak Tamazigh

The prevalence of consanguinity in Morocco was found to be *15.25%* with a mean inbreeding coefficient of 0.0065.

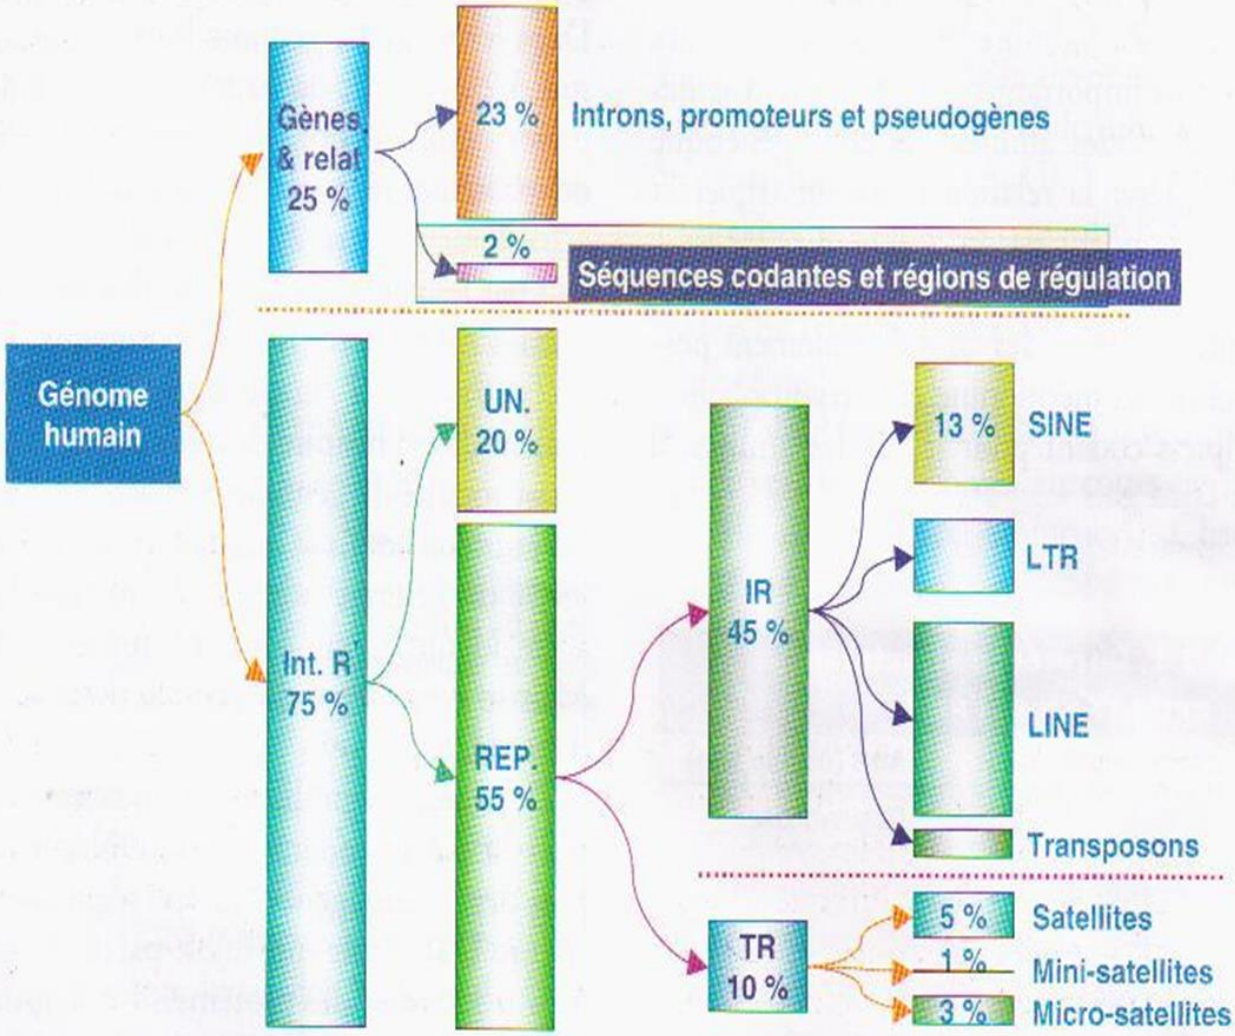
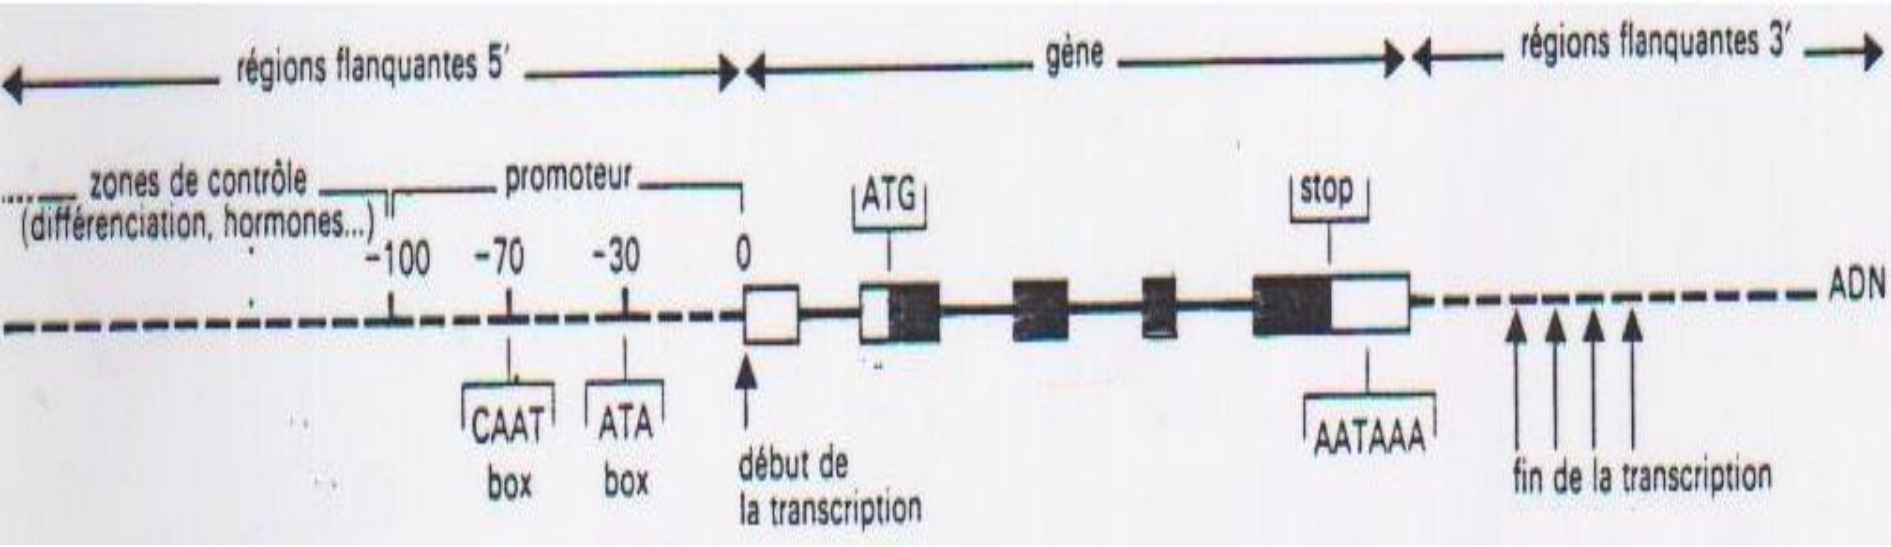
Description et composition générale du génome humain



Composition générale du génome humain. Le pourcentage représente la quantité de séquences par rapport à la séquence totale connue du génome. Gènes & relat : gènes et séquences associées ; Int. R : régions intergéniques ; Un. : séquences intergéniques uniques ; Rep. : séquences intergéniques répétitives ; IR : séquences intergéniques répétitives dispersées ; TR : séquences intergéniques répétées en tandem.

Anatomie d'un gène

Le gène d'un eucaryote est morcelé en fragments codants : **les exons** (dont la taille varie en moyenne entre 50 et 200 pb), séparés en général par des séquences non codantes : les introns. En amont du gène, se trouve une **séquence régulatrice** et le **promoteur.**



Structure d'un gène codant une protéine chez les eucaryotes

A quelques exceptions près, tous les gènes des eucaryotes possèdent des introns. Le nombre et la taille des introns varient d'un gène à un autre.

Les gènes de l'ADN mitochondrial sont sans introns.

Structure des gènes

Anatomie d’un gène

Promoteur :

En amont du gène en 5', se trouve la région promotrice ou promoteur et la séquence régulatrice de la transcription du gène.

Gène :

Un gène est une entité discontinue dans laquelle les parties codantes (**Exons**) sont en général séparées entre elles par des parties non codantes (**Introns**) éliminées au cours de la maturation de l'ARNm.

Introns

Certains introns jouent un rôle important dans la **régulation de l'expression d'un gène**.

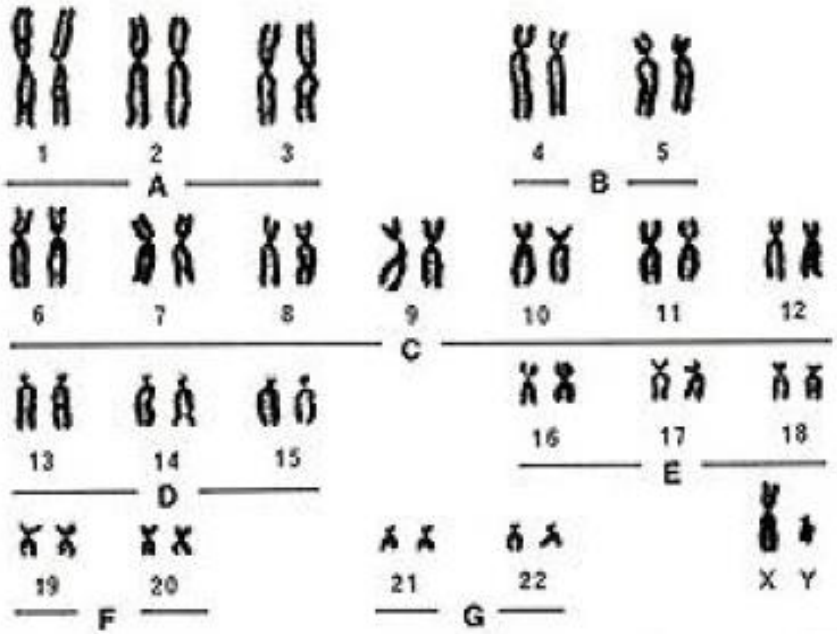
HISTORIQUE



1959 Trisomie 21 Lejeune

Chromosomes et cancers

HISTORIQUE

3 évènements majeurs

- **Chromosome Ph1 et LMC**
  1960 : NOWELL et HUNGERFORD

- **Techniques de bandes**
  1970 : CASPERSSON QFQ
  1972 : Janet ROWLEY t(9;22)
  1980 : SANDBERG
  répertoire des anomalies

- **Découverte des oncogènes** (C-src)
  1976 : D. STEHELIN

  puis **gènes suppresseurs de tumeur**

hémopathies malignes

Anomalies chromosomiques en onco-hématologie

- **Acquises**

- **Clonales** toutes les cellules possèdent la même anomalie primaire.

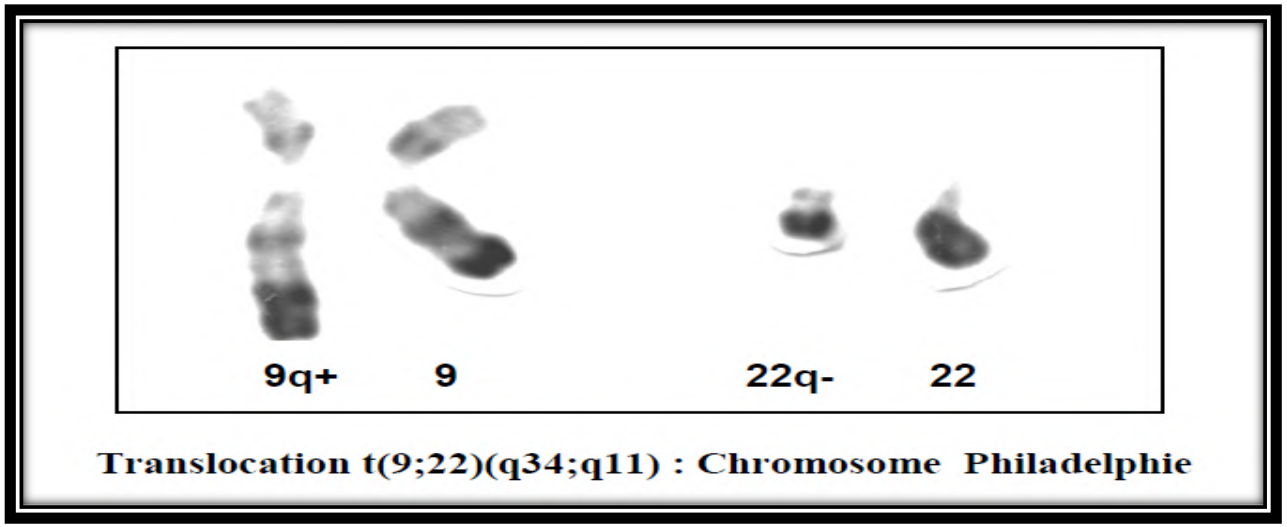
- **Limitées aux cellules malignes**

- **Non aléatoires** Retrouvées plus souvent que ne le voudrait le hasard, plus ou moins spécifiques d'un type de leucémie

- **Primaires ou secondaires**

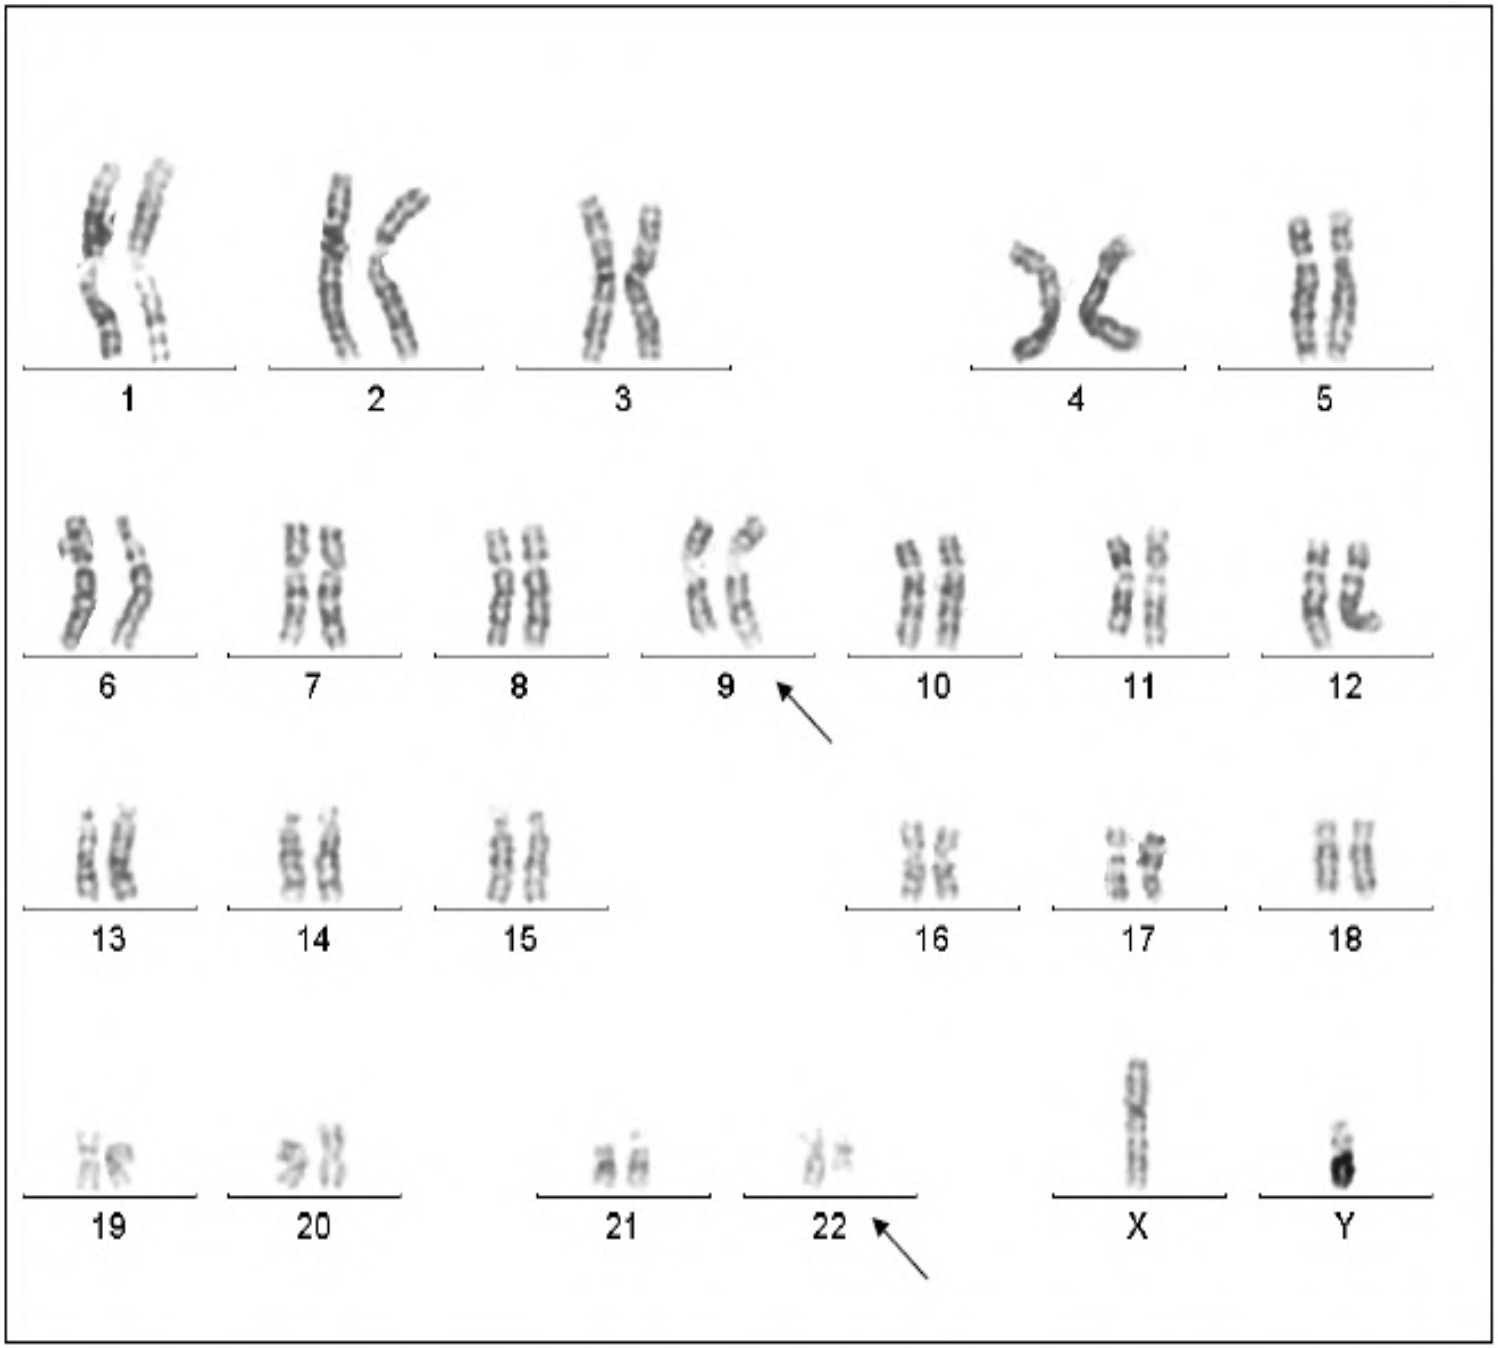
La leucémie myéloïde chronique (LMC)

- La LMC a bénéficié très tôt d'un marqueur biologique : le chromosome de Philadelphie ,(Ph1).
- Il fut dès lors reconnu comme marqueur spécifique (non pathognomonique) dans la LMC.
- Il s'agit d'une translocation réciproque entre les chromosomes 9 et 22, cassés respectivement en 9q34 et 22q11.
- Il apparaît parfois sous une forme variante (moins de 10% des cas) se traduisant par des translocations complexes impliquant un ou plusieurs chromosomes en plus du chromosome 9 et du chromosome 22



Translocation t(9;22)(q34;q11) : Chromosome Philadelphie

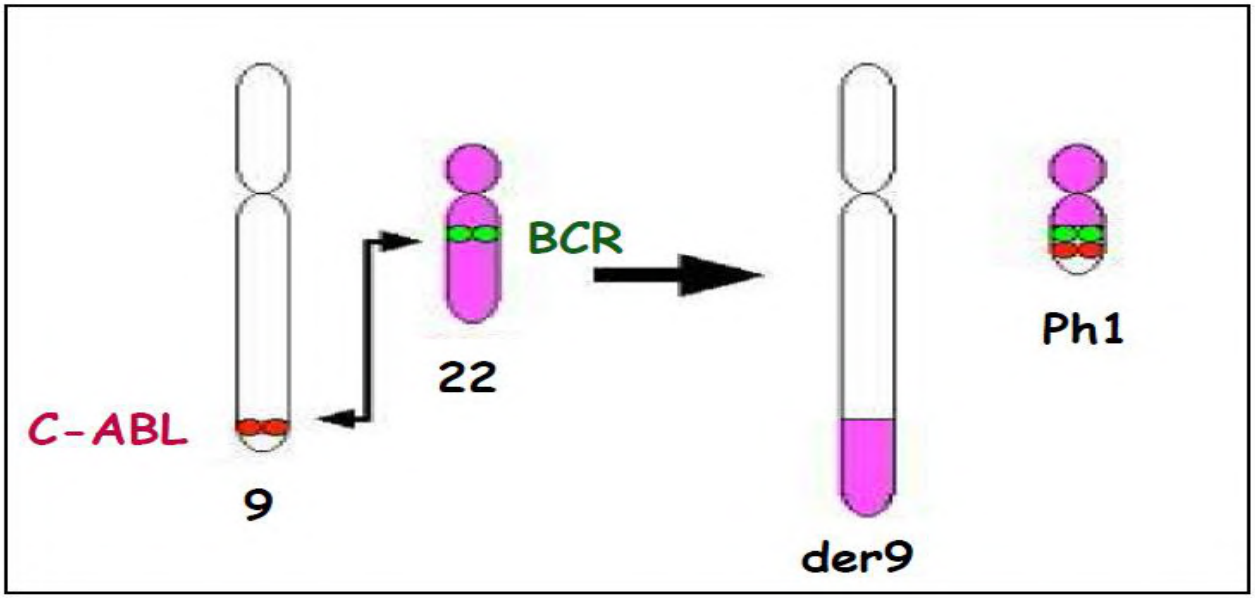
Association quasi constante à la t(9;22)



La leucémie myéloïde chronique (LMC)

L'équivalent moléculaire du chromosome Ph1 est le **gène de fusion BCR-ABL**,

transcrit en un ARNm hybride et traduit en une **protéine de 210 KDa** à forte activité **tyrosine kinase,** jouant un rôle dans la **leucémogénèse**



La leucémie myéloïde chronique (LMC)

Leucémie Myéloïde Chronique (LMC) et Caryotype

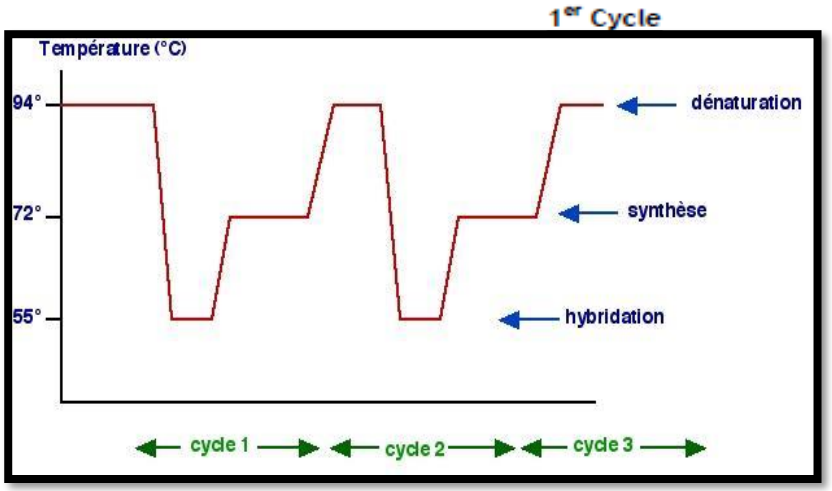
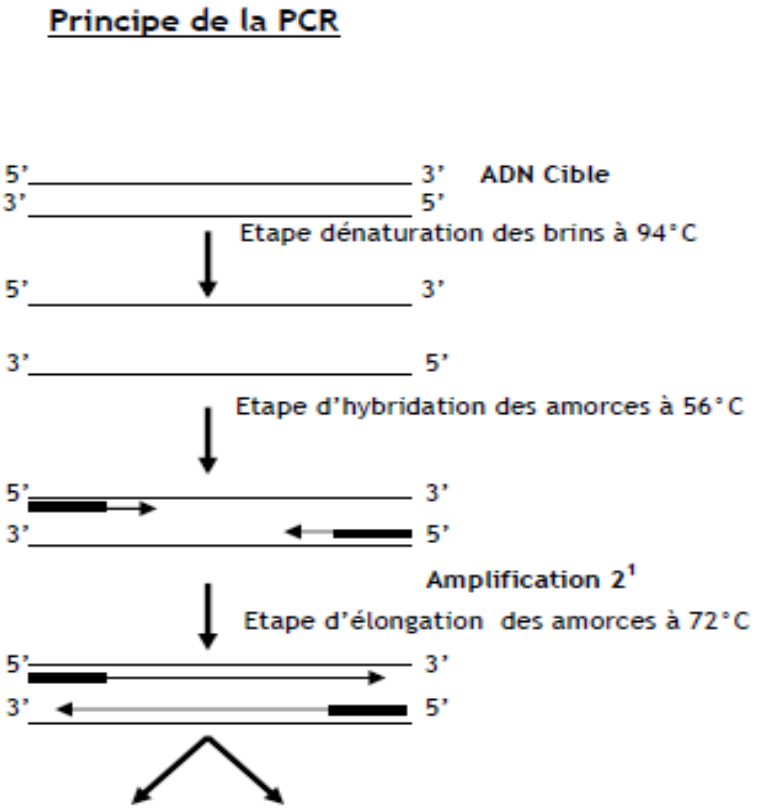
REACTION DE POLYMERISATION EN CHAINE (PCR)



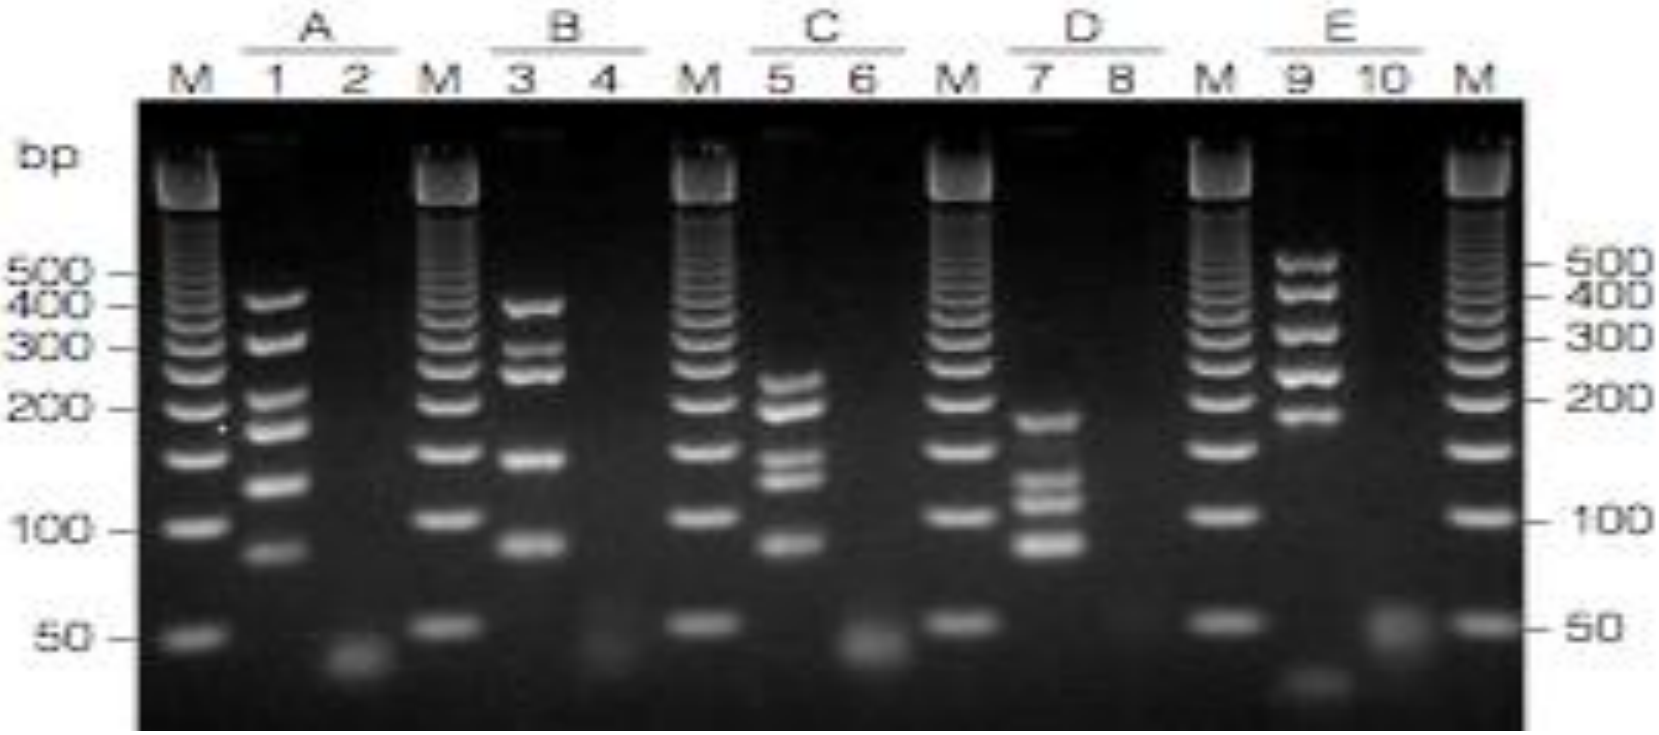


- Chaque brin néo-synthétisé sert de **matrice** pour une nouvelle synthèse au cycle suivant.

- Après **n** cycles on aura une amplification exponentielle de la séquence d'ADN cible (2n copies où n représente le nombre de cycles effectués).

➢L'analyse moléculaire du bras long du chromosome Y permet de mettre en évidence des **microdélétions des régions AZF** (azoospermia factor)

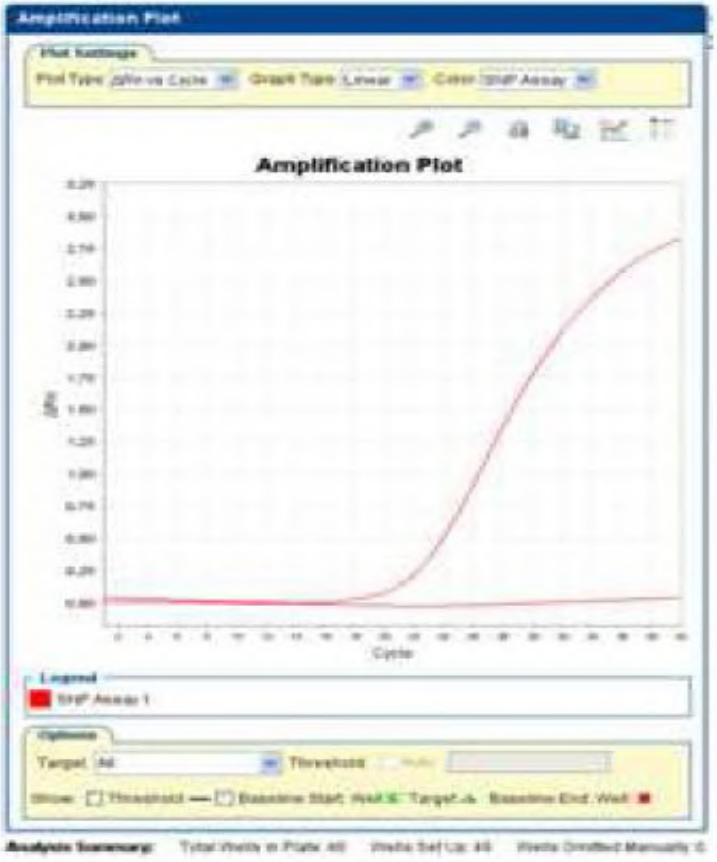
Azoospermia factor

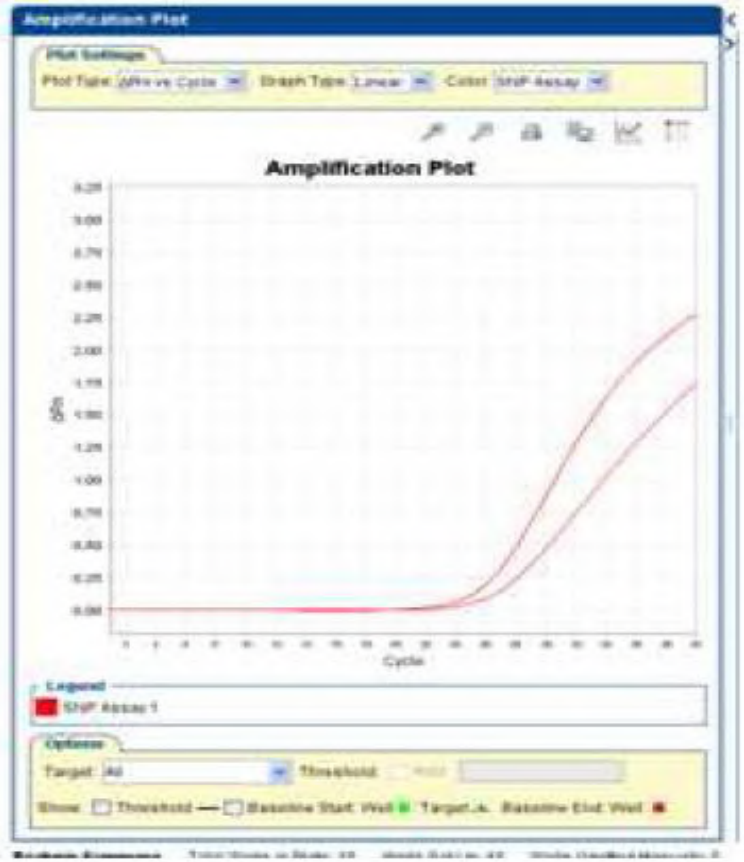


Example of amplification of male genomic DNA. AZF Multiplex PCR

LA PCR EN TEMPS REEL

La PCR en temps réel utilise le principe de base de la PCR classique, avec pour différence une amplification mesurée non pas en final mais tout au long de la réaction, donc en **temps réel**.





Recherche de mutation par RT PCR et sonde spécifique d'allèle : méthode Taqman

A

Une erreur sur les 3 milliards de perles de notre génome

Limites des techniques "traditionelles" de séquençage d' ADN

- L'analyse d'un gène entier est souvent laborieuse
- Plusieurs gènes sont souvent impliqués dans une maladie:
  - Cancer du côlon héréditaire (8 gènes)
  - Ataxies (>80 gènes)
  - Vision/cécité (>100 gènes)
  - Retard mental (~500 gènes)
- Problèmes de détection des variations structurelles (de grande taille)
- Bases génétiques des maladies complexes peu connues

→ **pas de test pour beaucoup de maladies monogéniques**

→ **pas de test pour les maladies complexes**

Whole genome sequencing (WGS)

Whole exome sequencing (WES)

	Where we are today	Where we will be in 2030
Clinical applications		
Genomics for disease	Primarily limited to rare disease and select cancers.	Genomics is routine. Genetic causes and targeted therapies are discovered for many "common" diseases. Microbiome measures are routinely included.
Pharmacogenomics (PGx)	Common in cancer and within select applications of older medications at select sites.	Genome-aware EHRs make PGx easy and automatically update rules from central guidelines. New PGx associations discovered from clinical data.
Genomics for healthy individuals	In research, whole-genome sequencing and search for mutations in one of the ACMG59 genes, present in about 3% of people. Variant interpretation is hard.	ACMG59 grows to > 200, variant interpretation improved by huge, diverse sequenced populations. Cell-free DNA becomes a mainstay of cancer screening
EHRs	Episodic capture from healthcare without robust genomics support. EHR data is essentially not portable.	Genome- and device- enabled. Data can be easily moved between EHRs and to participant apps.
Environmental influences on health	Patient-reported habits and exposures	Geocode-based exposure linkage Real time monitoring of multiple environmental exposures Precision nutrition
Wearable sensors	Ad hoc use of activity monitors	Continuous monitoring of physical activity, sleep, metabolic parameters

Routine clinical genomics to guide prevention, diagnosis, and therapy

Sequencing $15.63.

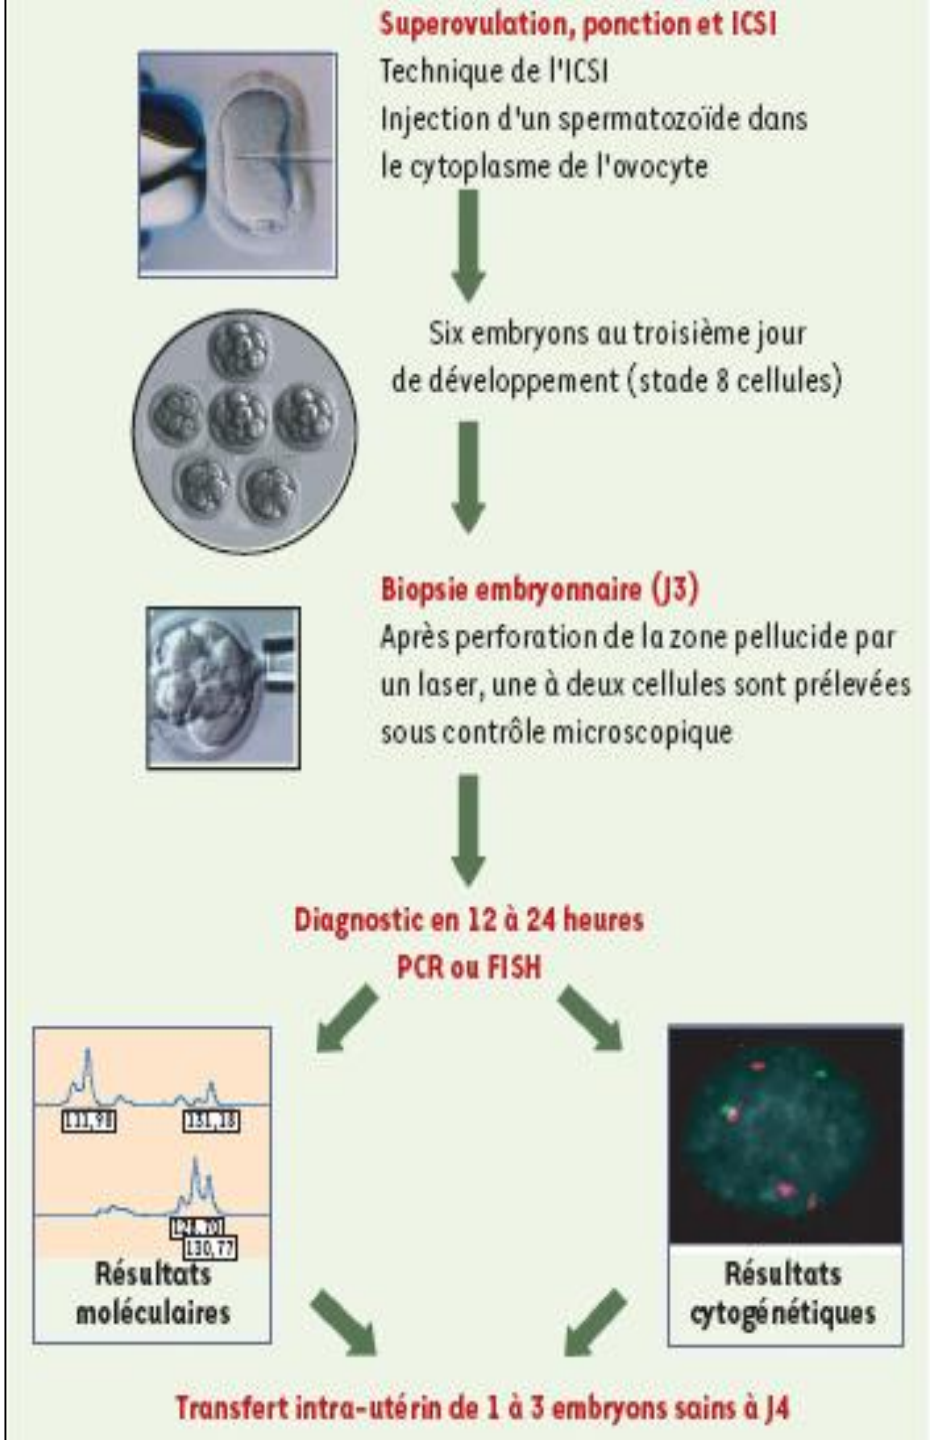
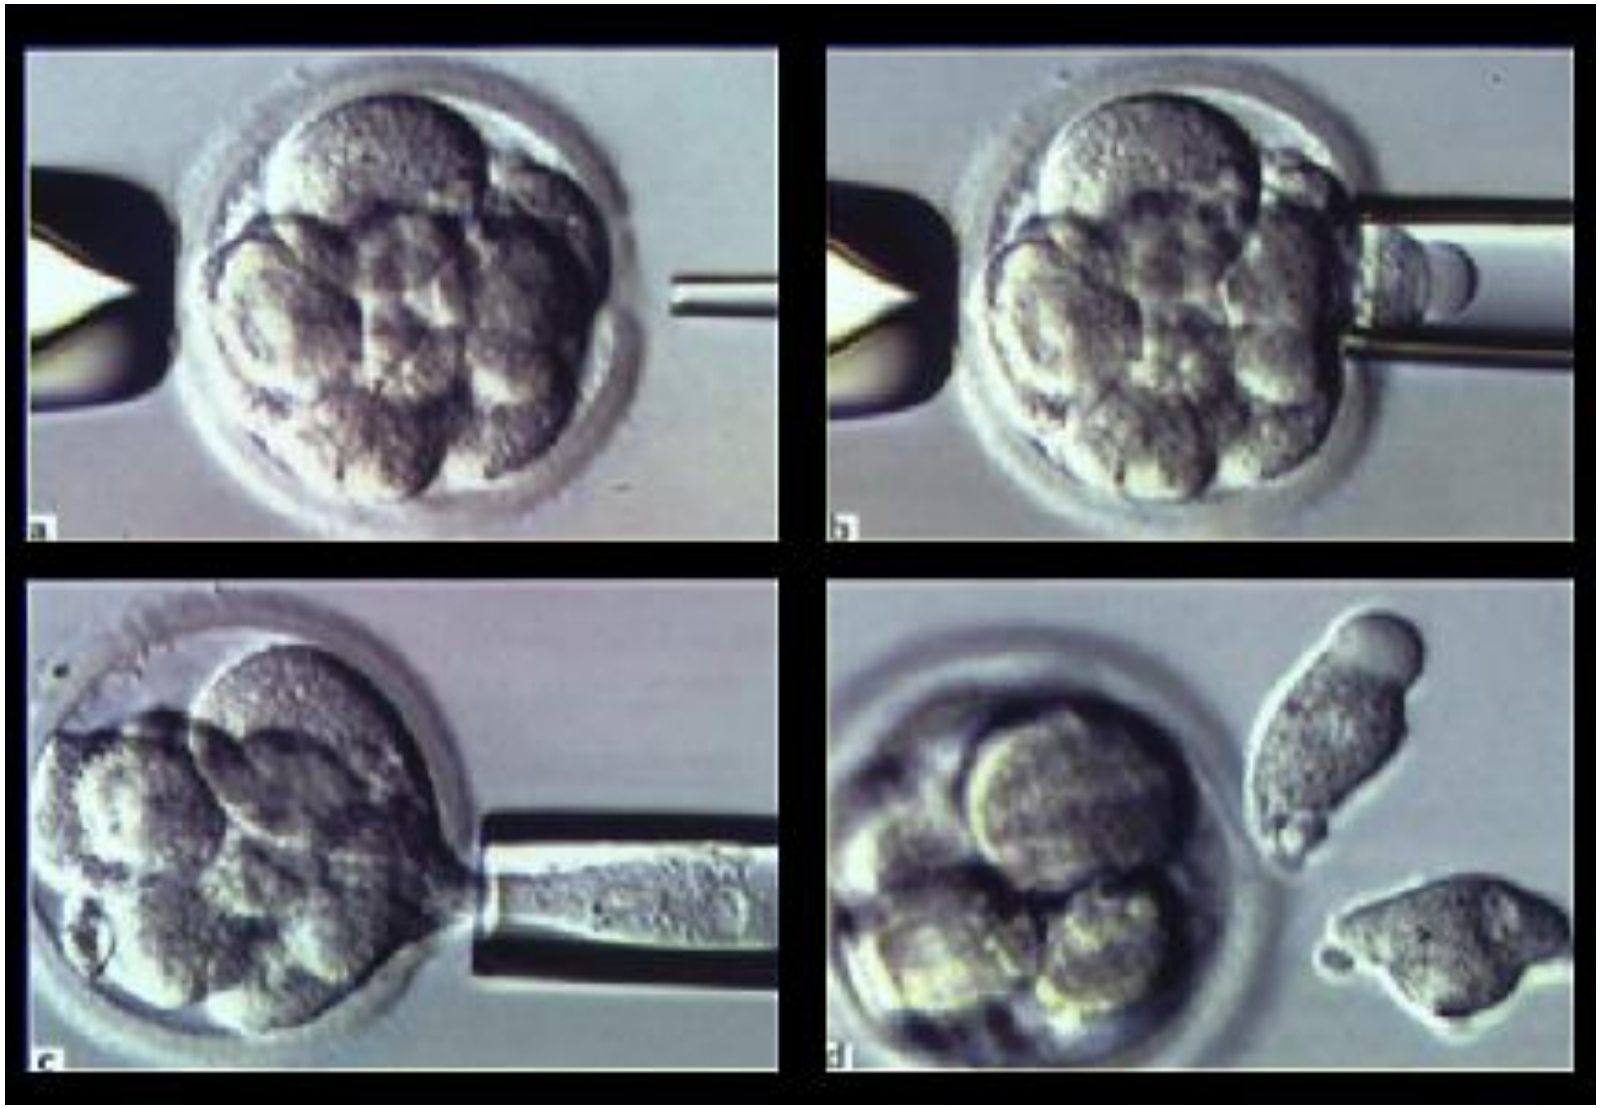
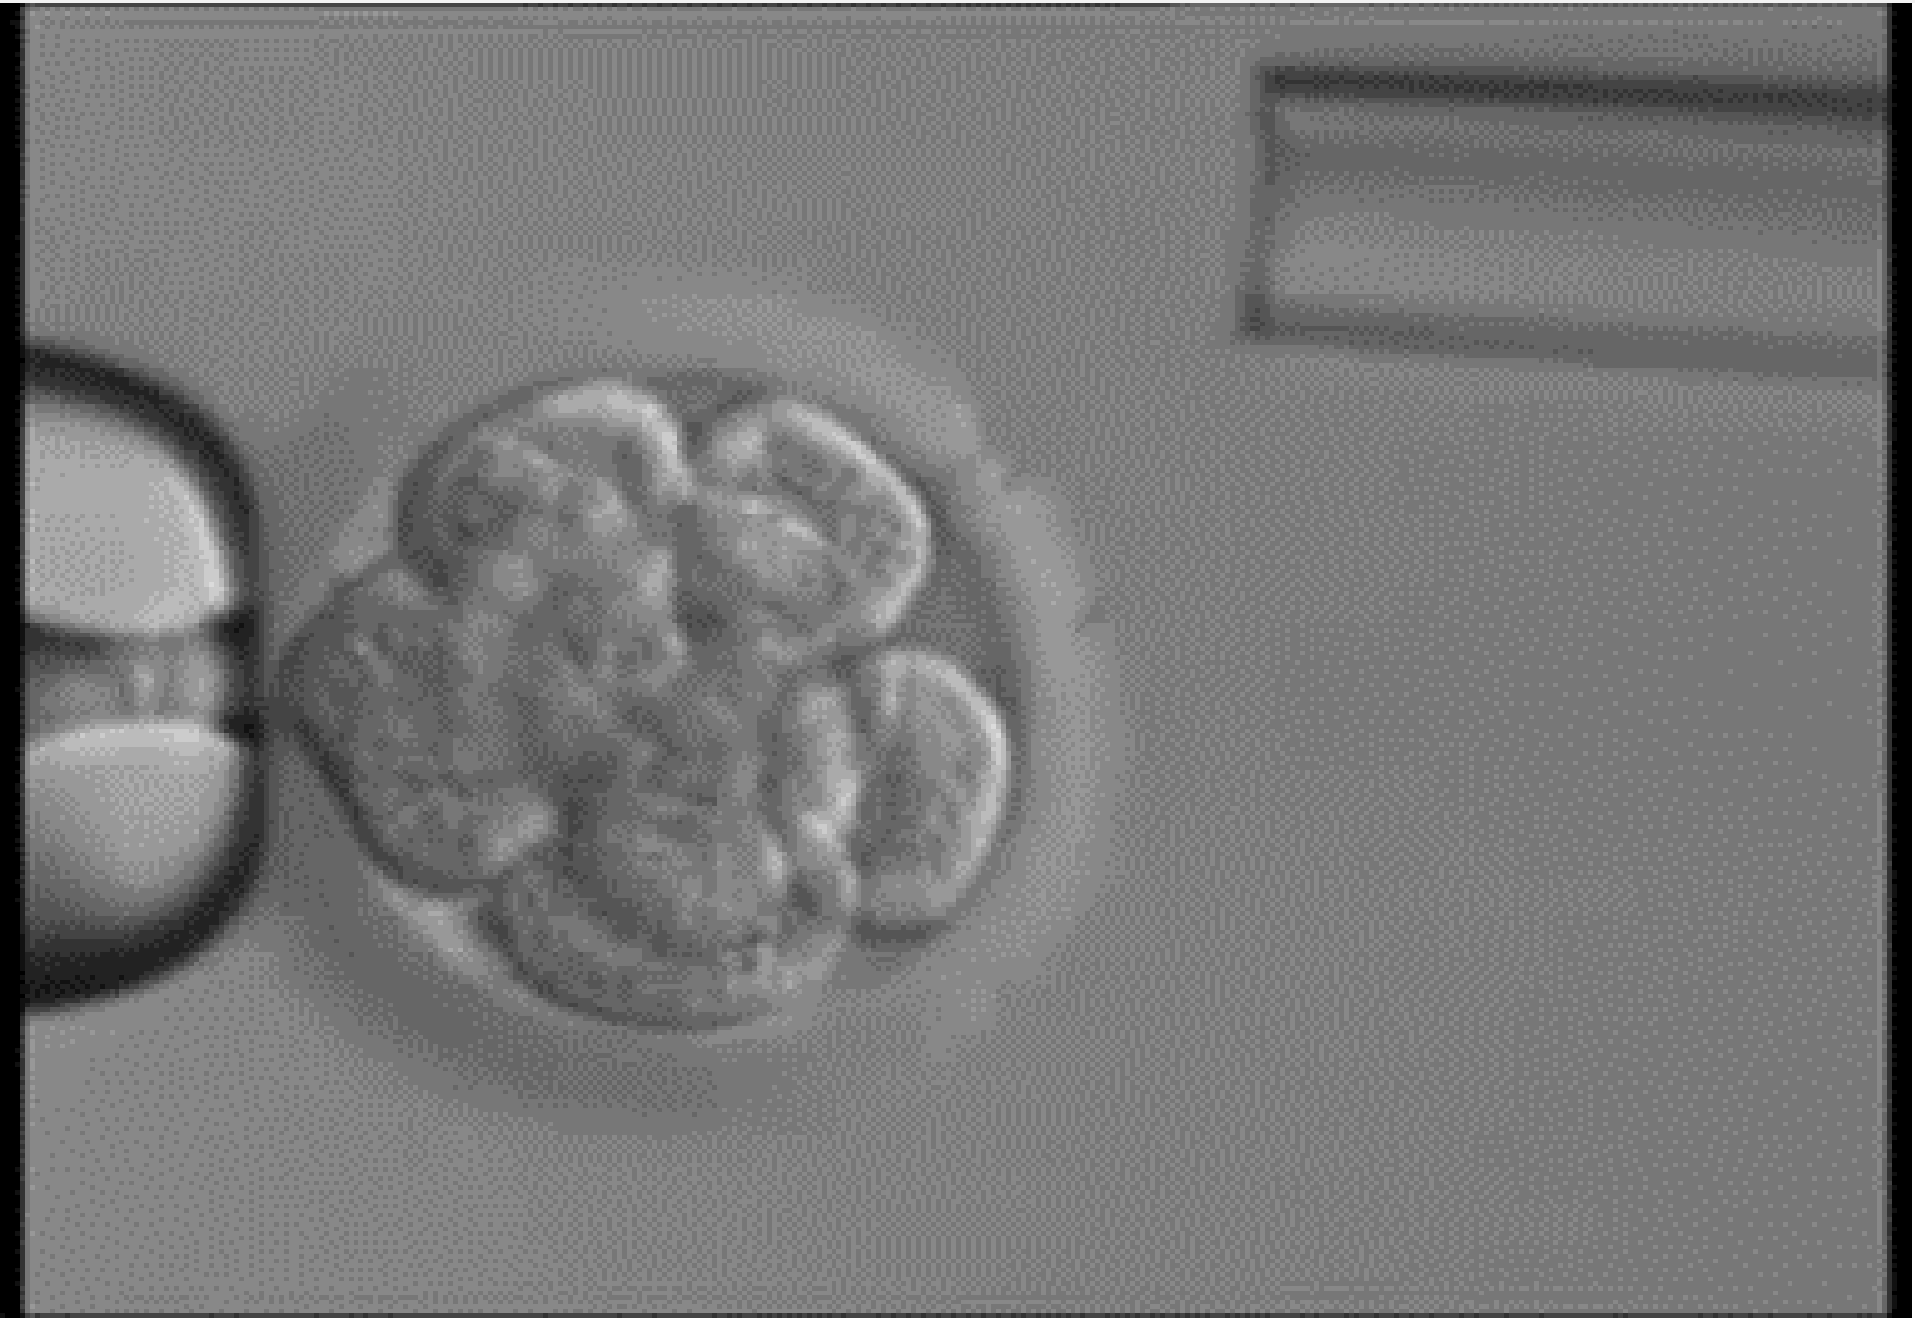
- ADN



Blastomère



Preimplantation Genetic Diagnosis (PGD)



Preimplantation genetic (PG) testing

Who benefits from PG testing?

PG testing has two broad categories

PG diagnosis

Tests embryos for specific genetic abnormalities that have been shown to exist in one or both parents

Purpose is to prevent the birth of affected children from parents with a known genetic abnormality

Widely acknowledged as acceptable for routine clinical application

PG screening

Tests for aneuploidy in embryos; parents have no diagnosed genetic abnormality

Purpose is to identify optimal embryos for uterine transfer in an IVF cycle and, in so doing, improve pregnancy success in certain patient populations

Its routine clinical application remains controversial

Brezina PR Brezina DS, Kearns WG Preimplantation genetic testing. BMJ. 2012 Sep 18;345

Preimplantation genetic (PG) testing

What is PG diagnosis?

PG diagnosis is the testing of embryos for **specific genetic abnormalities known** to exist **in one or both parents**

Diagnosis is appropriate for:

- Autosomal recessive diseases in which both parents are known genetic carriers, such as cystic fibrosis or sickle cell disease
- Autosomal dominant diseases in one or both parents, such as Huntington's disease
- X linked diseases (such as haemophilia)
- Any parent who harbours certain balanced chromosomal translocations or inversions

Diagnosis is not appropriate for:

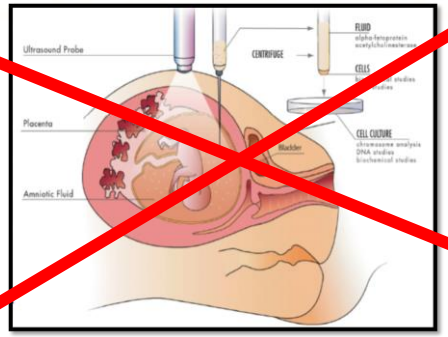
- Medical conditions in parents in whom a definitive genetic cause has not been identified
- Testing for non-medical phenotypic traits, such as eye or hair colour

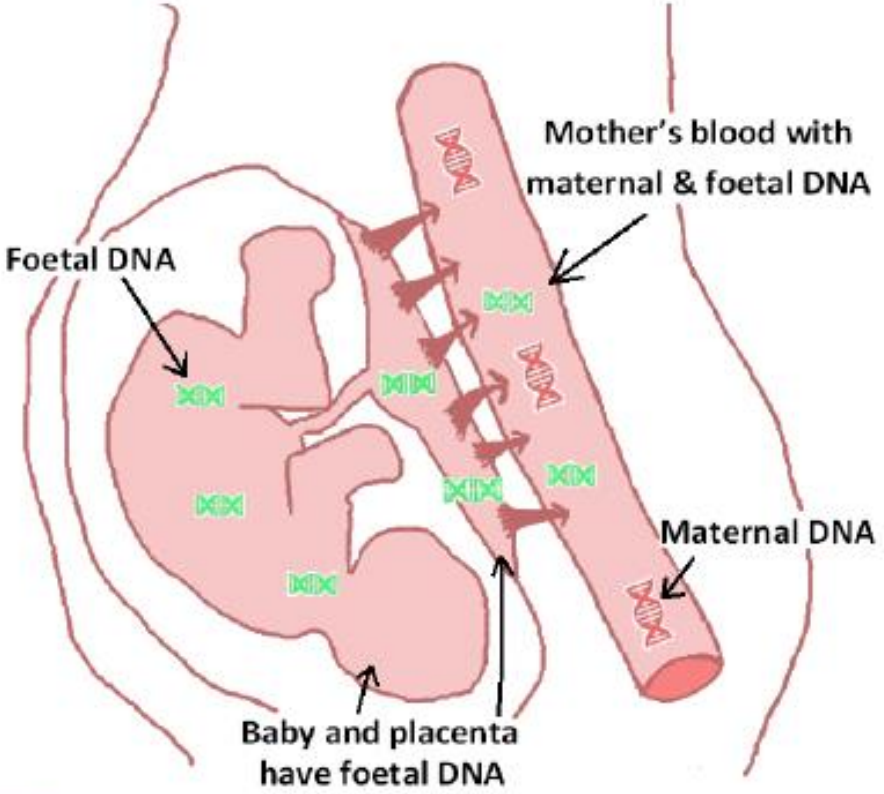
Diagnosis is controversial for:

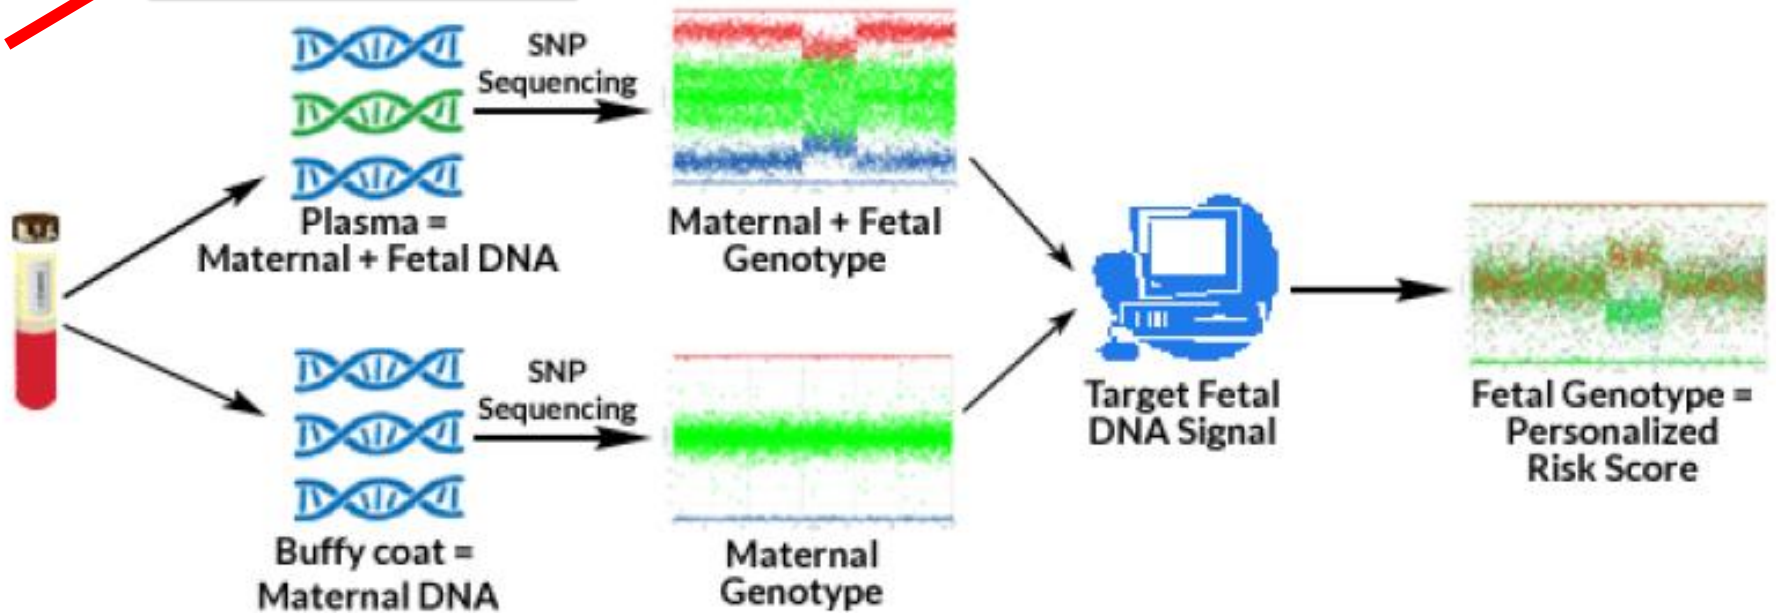
- Sex selection for the purposes of family balancing
- HLA matching for the purposes of creating a tissue donor for an existing diseased sibling

Brezina PR Brezina DS, Kearns WG Preimplantation genetic testing. BMJ. 2012 Sep 18;345

NIPT: non-invasive prenatal test







Diagnostic prénatal non invasif

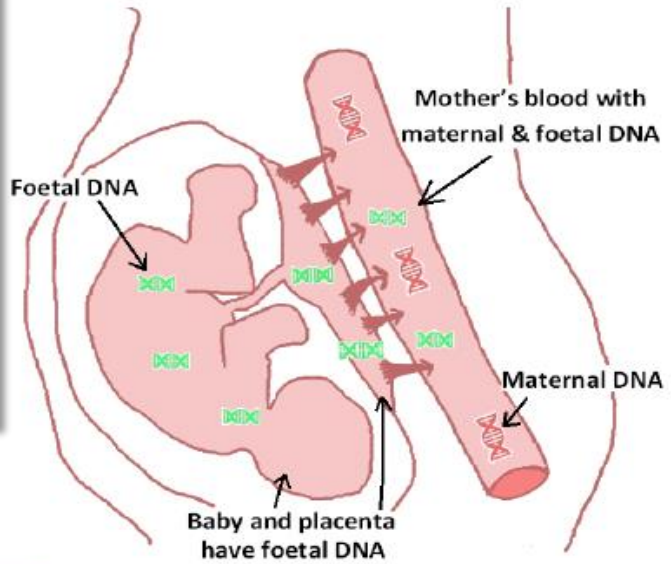
Clinical information: normal pregnancy, gestational age: 12 weeks, maternal weight: 66kg, maternal height: 163cm.

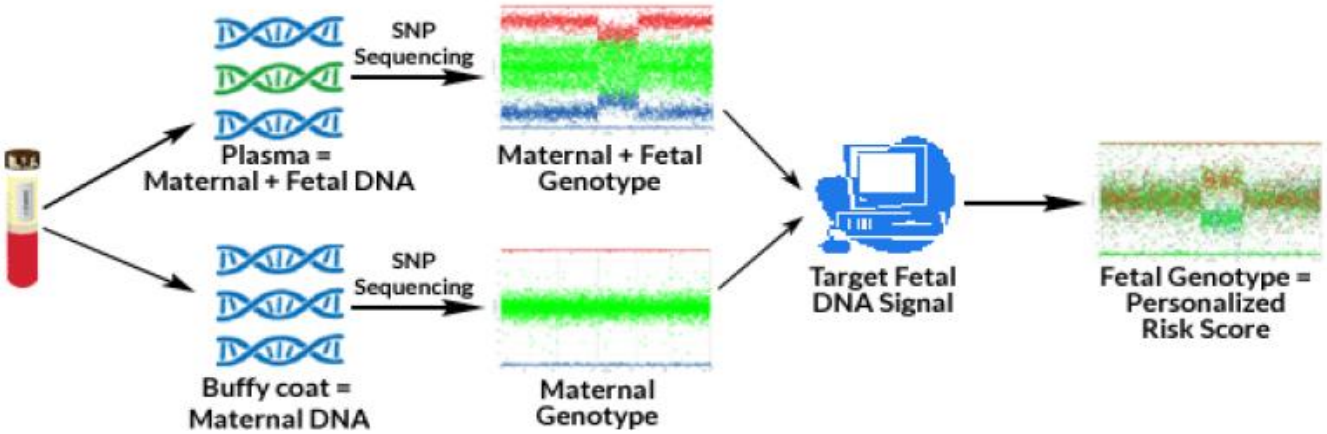
Results:

	Aneuploidy detected (Y/N)
Chromosome 21	No
Chromosome 18	No
Chromosome 13	No
Gonosomal chromosomes	No
Fetal Fraction (xx %):	7%
Fetal gender	male

The analysis did not indicate a trisomy of chromosome 13, 18, or 21 or gonosomal abnormalities.

However, the test cannot entirely exclude this due to the possibility of fetoplacental mosaicism. If the fetus shows abnormalities on ultrasound investigation, or if a family history of fetal abnormalities or other genetic disorders exists, invasive testing and subsequent analysis by karyotyping or additional genetic analysis should be considered.





Male infertility…… Genetic factors

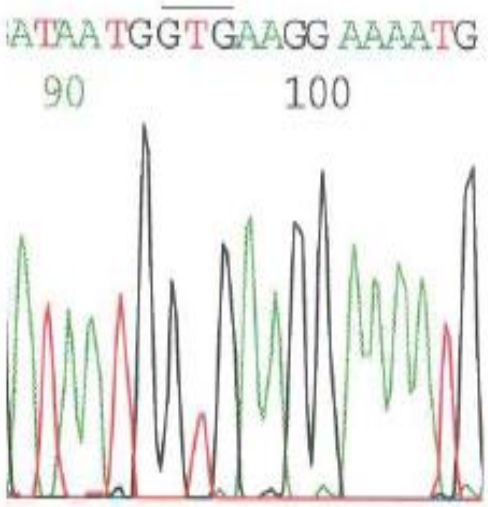
The common Cresponsible for male infertility are :

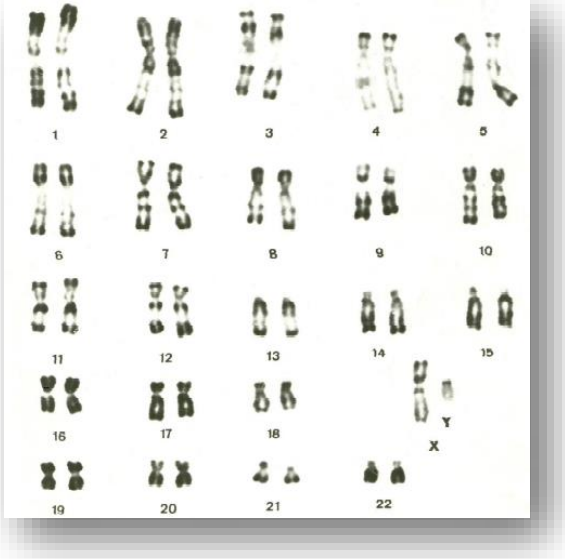
- **Chromosomal abnormalities**
- **Yq microdeletion**
- **Cystic fibrosis.**

30 % **percent cases of male infertility.**

- **About 40 % cases of male infertility are categorized as idiopathic :**

Genetic and genomic abnormalities.



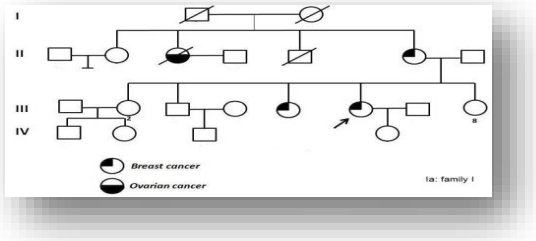


Halder A, Kumar P, Jain M, Kalsi AK. Genomics: Tool to predict and prevent male infertility. Front Biosci (Schol Ed). 2017 Jun 1;9:448-508.

Couples with ..... Male infertility

General considerations on genetic testing

Clinical Genetics



Genetic consuling

Clinical Diagnosis

Genetic counseling

Genetic testing

Familial history

Clinical-genetic examinations

Genetic counseling, focusing on an extensive evaluation of the familial history and, if necessary, clinical-genetic examinations, is required in order to decide whether and which further genetic testing is appropriate for the couple.

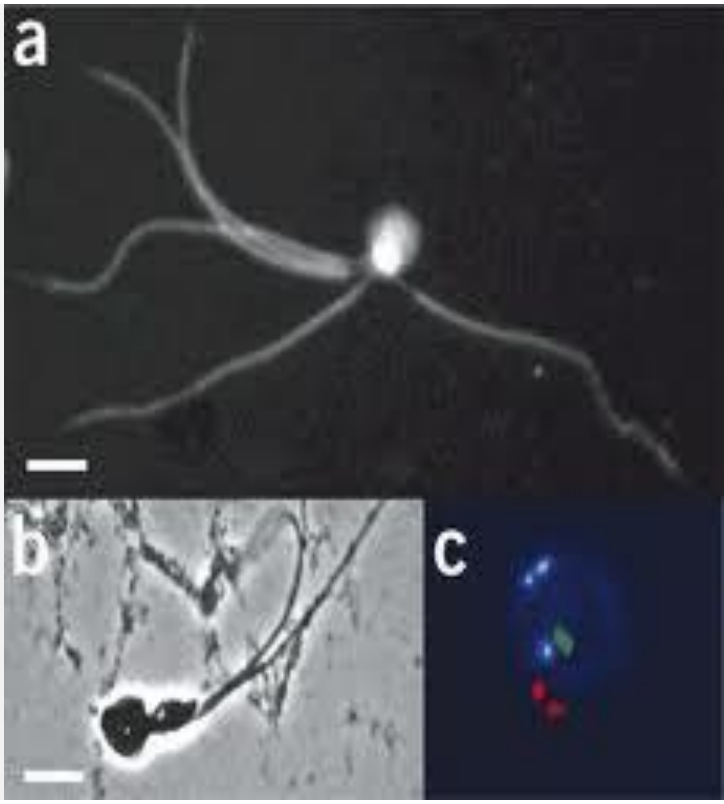
GENETIC CAUSES OF MALE INFERTILITY

Testicular failure

Mutations AURKC gene

- **Infertility in men from the Maghrebian region :**
  - Morocco,
  - Tunisia
  - Algeria
- **Homozygous c.144delC AURKC**
- **Sperm with :**
  - 4N chromosomal complement,
  - large heads
  - often multiple tails.



Homozygous mutation of AURKC

Dieterich K, Soto Rifo R, Faure AK, Hennebicq S, Ben Amar B, Zahi M, Perrin J, Martinez D, Sèle B, Jouk PS, Ohlmann T, Rousseaux S, Lunardi J, Ray PF. Homozygous mutation of AURKC yields large-headed polyploid spermatozoa and causes male infertility. Nat Genet. 2007 May;39(5):661-5. Epub 2007 Apr 15.

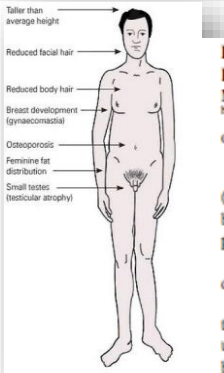
GENETIC CAUSES OF MALE INFERTILITY

Testicular failure

Aneuploidy

Klinefelter syndrome (47,XXY)

- Clinical and cytogenetic heterogeneity :
  - 47,XXY
  - mos 47,XXY/46,XY ….



- Progeny of XXY men by ICSI (intracytoplasmic sperm injection) after TESE (testicular sperm extraction) have been described.
- They have an increased risk for gonosomal aberrations.

47,XXY

HEREDITARY RISK IN ICSI WITH SPERM FROM NON-MOSAIC KLINEFELTER SYNDROME PATIENTS. T. Miki,[a] A. Tanaka,[a] M. Nagayoshi,[a] S. Watanabe.[b] [a]Saint Mother Hospital, Kitakyusyu, Japan; [b]Anatomical Science, Hirosaki University Graduate school of Medicine, Hirosaki, Japan.

OBJECTIVE: To verify the actual risk of hereditary Klinefelter Syndrome (KS) or incidental aneuploidy in ICSI treatment of KS patien… which has been warned in previous cytogenetic studies using testic… om KS patients.

DESIGN: Cytogenetic analysis in KS patien… nd delivered babies.

MATERIALS AND METHODS: 1) … treatment of KS patients in our ho… using amniocentesis or periph… bridization (FISH) analy… out in morphological… identified and is… tients, respe… ents an… de…

O-160 Tuesday, October 18, 2016 12:00 PM

HEREDITARY RISK IN ICSI WITH SPERM FROM NON-MOSAIC KLINEFELTER SYNDROME PATIENTS. T. Miki,[a] A. Tanaka,[a] M. Nagayoshi,[a] S. Watanabe.[b] [a]Saint Mother Hospital, Kitakyusyu, Japan; [b]Anatomical Science, Hirosaki University Graduate school of Medicine, Hirosaki, Japan.

…were … KS patients, and their parents … chromosome was de… s, according to the manufacturer's … extracted from blood sample… sent. Multiplexed PCR amplification … ducted using an Investigator Argus … resis was run on an ABI PRISM 3100 … products. The data obtained was analyzed … ware.

… chromosomal abnormality was found in 45 KS patients examined. 2) In the most of 5 KS patient's testes examined, sp… osaki, Japan … showed XY and XXY mosaicism. However, the sex chromosome constitution of all primary spermatocytes and spermatids was normal, suggesting the possibility that XXY spermatogonia can not enter meiosis. In one case, there were no XXY spermatogonia. 3) X-chromosomal STR DNA profiles were compared among KS patient and their parents. In 3 of the 4 KS patients, both two X chromosomes were maternal origin, showing that an extra X chromosome was left in an oocyte as a result of chromosomal non-disjunction at the 1st or 2nd meiotic division. In one patient, X-chromosomes were inherited from parents, suggesting that fertilization of XY-sperm is the cause of KS. In addition, it was surmised that 12 cases in 18 patients showed maternal origin and 6 in 18 patients were paternally. Although the sample number applied for X-chromosomal STR DNA profiling is not enough, the present data may indicate that contribution of XX oocyte to the production of XXY embryos is greater than XY sperm. Namely, a XX oocyte penetration by a Y sperm is the main cause of KS.

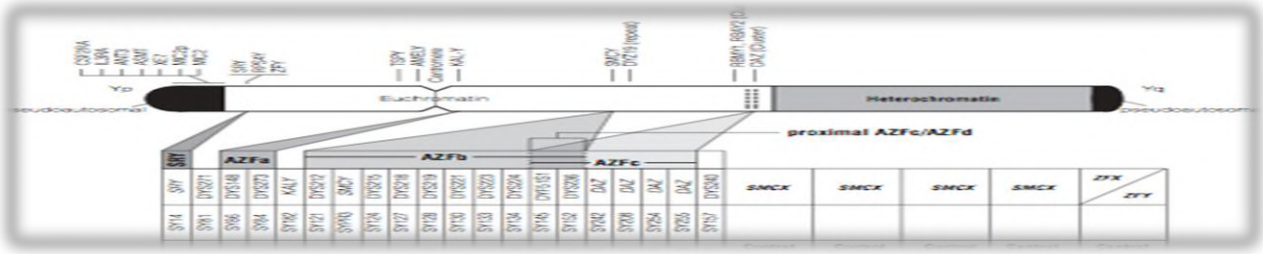
CONCLUSIONS: All data indicates that the risk of KS baby resulting from ICSI treatment of KS patient couples may be a lot lower than expected from the previous studies. Cytogenetic analysis with smear of testicular cell mixture that was used in the studies may overestimate chromosomal abnormality. This finding encourages the opinion that we should strongly recommend vigorous treatment with ART for KS patients.

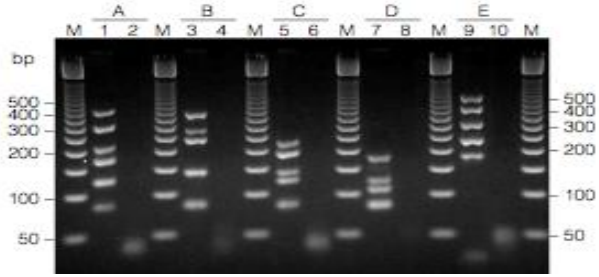
Couples with infertility

2. Genetic testing in male infertility

Molecular genetic testing

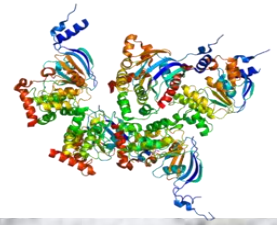
Azoospermia factor





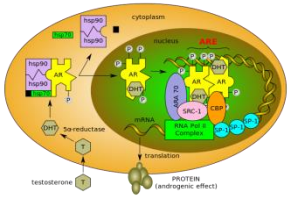
Cystic fibrosis gene mutations

Homozygous or compound heterozygous for CFTR mutations.



Further mutations and syndromes

Several hundred mutations of AR have been described with resultant phenotypes ranging from testicular feminization to partial androgen insensitivity syndrome to male infertility

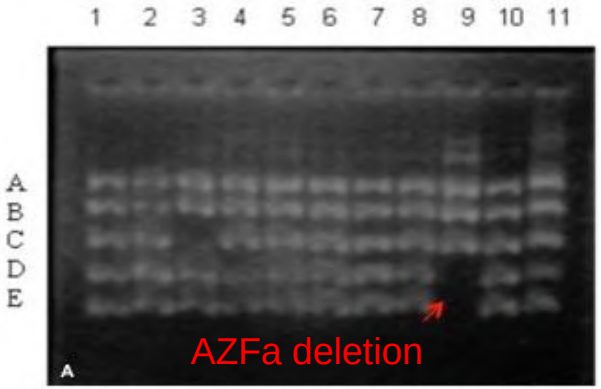


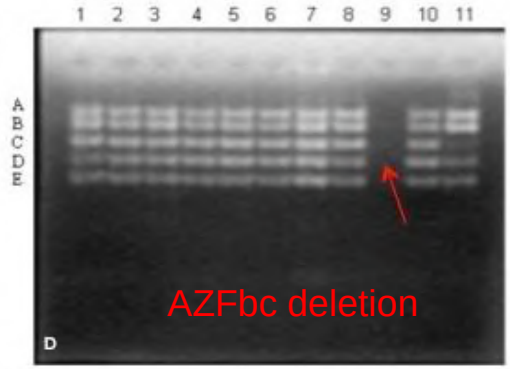
GENETIC CAUSES OF MALE INFERTILITY

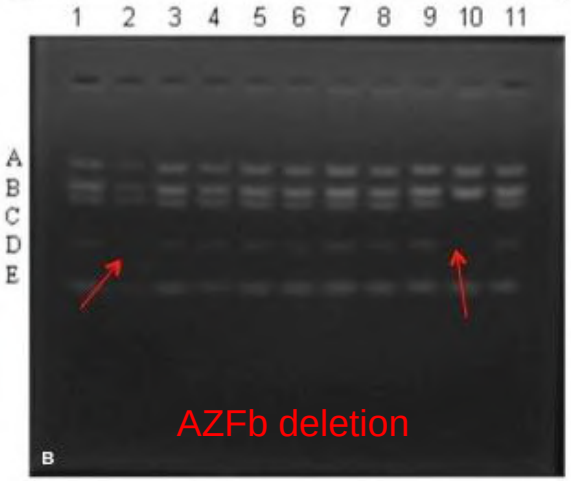
Testicular failure

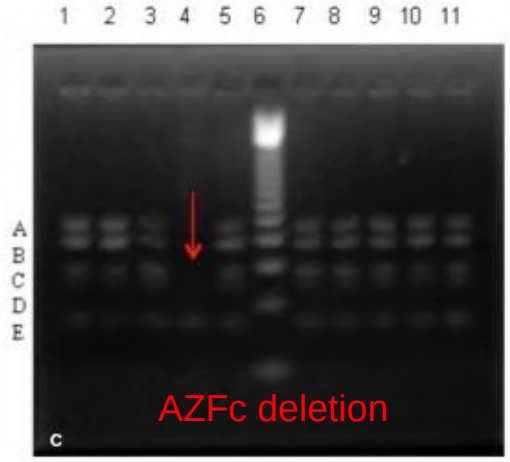
Azoospermia factor

Microdeletions of the long arm of the Y chromosome are now recognized as a relatively common cause of primary testicular failure (severe oligospermia and azoospermia), affecting up to 20% of men with infertility









A summary of potential gene biomarkers involved in male infertility.

Gene	Name	Location
AZF	Azoospermia factor	Yq11
CFTR	Cystic fibrosis transmembrane regulator	7q31.2
SHOX	Short stature homeobox	Xp22.33; Yp11.3
USP8	Ubiquitin-specific peptidase 8	15q21.2
UBD	Ubiquitin D	6p21.3
EPSTI1	Epithelial-Stromal interaction 1	13q13.3
LRRC32	Leucine-rich repeat containing 32	11q13.5–q14
PDE3A	Phosphodiesterase 3A	12p12
EFCAB4B	EF-hand calcium-binding domain 4B	12p13.32
COBL	Cordon-bleu WH2 repeat protein	7p12.1
ATP8A1	ATPase, aminophospholipid transporter (APLT), class I, type 8A, member 1	4p13
MASP1	Mannan-binding lectin serine peptidase 1	3q27–28
PROK2	Prokineticin 2	3p13
AHRR	Aryl-hydrocarbon receptor repressor	5p15.3
MTHFR	Methylenetetrahydrofolate reductase	1p36.3
UBE2B	Ubiquitin-conjugating enzyme E2B	5q31.1
CREM	cAMP responsive element modulator	10p11.21
TSPY1	Testis-specific protein, Y-linked 1	Yp11.2
CLU	Clusterin	8p21–p12
PRM2	Protamine 2	16p13.2
PSG1	Pregnancy-specific beta-1-glycoprotein 1	19q13.2
HLA-E	Major histocompatibility complex, class I, E	6p21.3
PLCD1	Phospholipase C, delta 1	3p22–p21.3
ADD1	Adducin 1 (alpha)	4p16.3
ACVRL1	Activin a receptor type II-like 1	12q13.13
AR	Androgen receptor	Xq12
ARNT	Aryl hydrocarbon receptor nuclear translocator	1q21
hCAP18	cAMP cathelicidin antimicrobial peptide	3p21.3
SPIN1	Spindlin 1	9q22.1
TEX101	Testis expressed 101	19q13.31
PGK2	Phosphoglycerate kinase 2	6p12.3
HIST1H2BA	Histone cluster 1, H2ba	6p22.2
SLC2A14	Solute carrier family 2 (facilitated glucose transporter), member 14	12p13.31

Somatic mutations in cancer pharmacogenomics

Drug	Drug target	Cancer type (or types)	Somatic markers
Cetuximab	EGFR	Colorectal, head and neck	*EGFR* and *KRAS*
Erlotinib	EGFR	Lung, pancreatic	*EGFR*
Exemestane	Aromatase	Breast	*ESR1*, *ESR2* and *PGR*
Gefitinib	EGFR	Lung	*EGFR*
Imatinib	BCR–ABL, KIT and PDGFRα tyrosine kinases	Chronic myeloid leukaemia, gastrointestinal	Philadelphia chromosome, *KIT* and *PDGFRA*
Lapatinib	ERBB2 receptor	Breast	*ERBB2*
Letrozole	Aromatase	Breast	*ESR1*, *ESR2* and *PGR*
Panitumumab	EGFR	Colorectal	*EGFR* and *KRAS*
Tamoxifen	Oestrogen receptor	Breast	*ESR1*, *ESR2* and *PGR*
Trastuzumab	ERBB2 receptor	Breast, stomach	*ERBB2*

HEMATOLOGIE

Syndromes Myéloprolifératifs

Leucémie myéloïde chronique (LMC)

t(9;22)(q34.1 ;q11.2)

Definition of Hematologic, Cytogenetic and Molecular Response

Hematologic	Complete (CHR)	WBC < 10 x 10^9/L
		Basophils < 5%
		No myelocytes, promyelocytes, myeloblasts in the differential
		Platelet count < 450 x 10^9/L
		Spleen non palpable
Cytogenetic	Complete (CCgR)	No Ph+ metaphases
	Partial (PCgR)	1- 35% Ph+ metaphases
	Minor (mCgR)	36-65% Ph+ metaphases
	Minimal (minCgR)	66-95% Ph+ metaphases
	None (noCgR)	> 95% Ph+ metaphases
Molecular	Complete (CMolR)	Undetectable BCR-ABL mRNA transcripts by real time quantitative and/or nested PCR in two consecutive blood samples of adequate quality (sensitivity > 10^4)
	Major (MMolR)	Ratio of BCR-ABL to ABL (or other housekeeping genes) ≤ 0.1% on the international scale

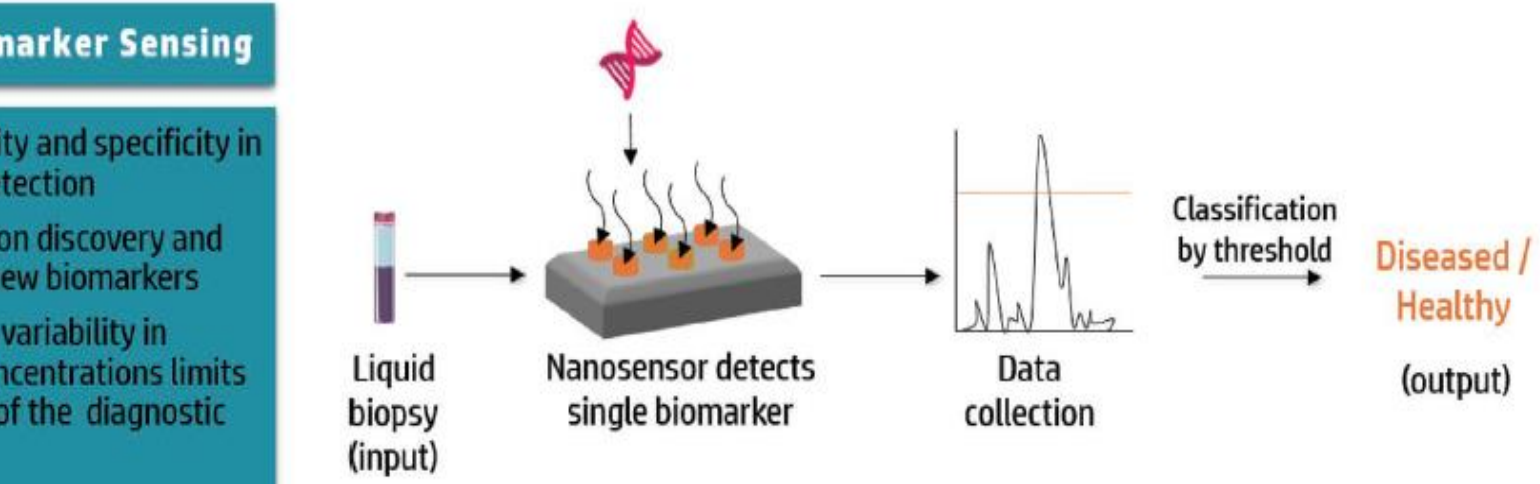
Integrating Artificial Intelligence and Nanotechnology for Precision Cancer Medicine

Single Biomarker Sensing

- High sensitivity and specificity in biomarker detection
- Dependence on discovery and approval of new biomarkers
- Inter-patient variability in biomarker concentrations limits the accuracy of the diagnostic prediction



Progress Towards Big Data Analysis

Multiplex Sensing

- Pattern-based analysis is not depended on a single biomarker
- Requires collection of large data sets for computing the classification pattern
- New approval procedures for pattern based diagnostics are required

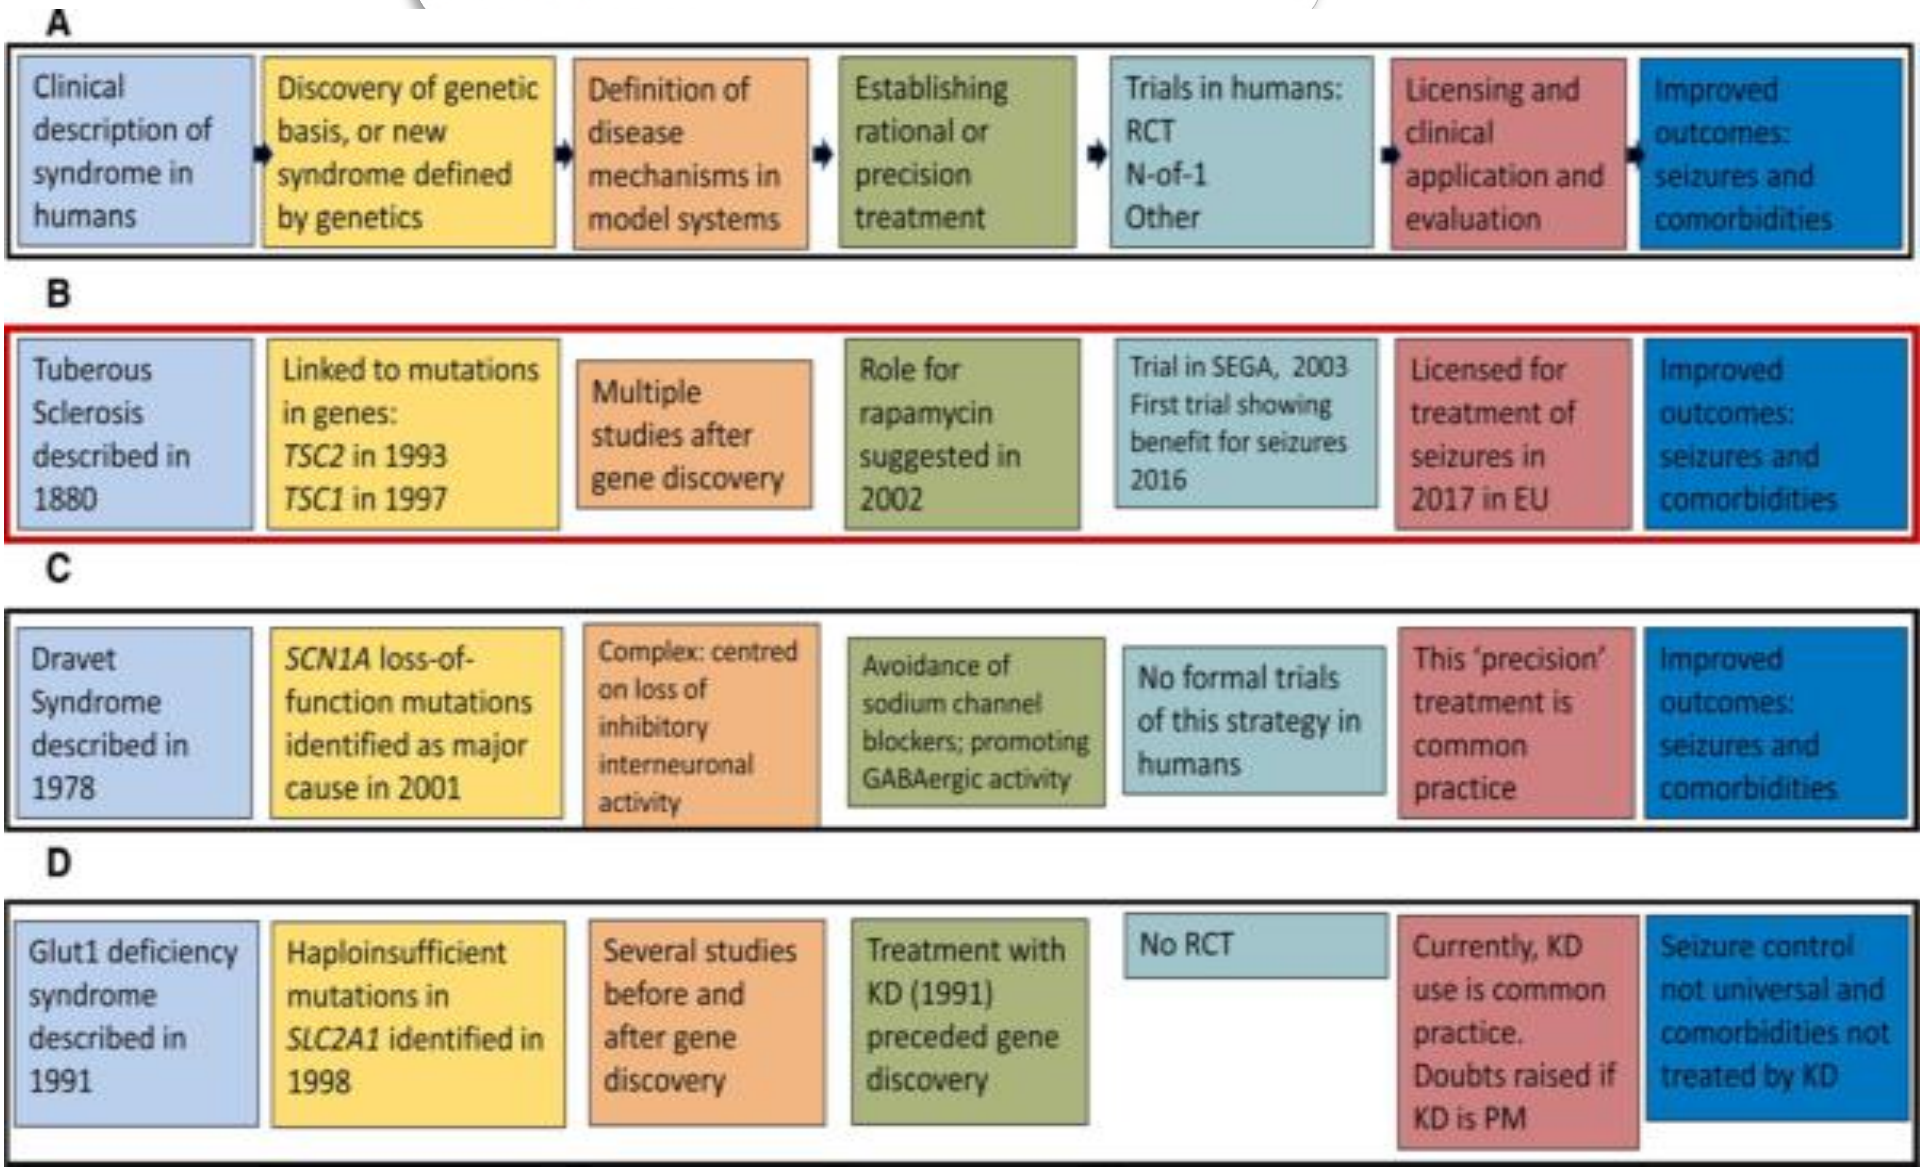
SUPPLEMENT ARTICLE

Epilepsia

Precision medicine and therapies of the future

Sanjay M. Sisodiya[1,2]



Real-life examples of more complex PM scenarios.

A

Clinical description of syndrome in humans	Discovery of genetic basis, or new syndrome defined by genetics	Definition of disease mechanisms in model systems	Establishing rational or precision treatment	Trials in humans: RCT N-of-1 Other	Licensing and clinical application and evaluation	Improved outcomes: seizures and comorbidities

B

No previous syndromic description	*KCNA2* de novo mutation-related DEE GoF in mutant protein	 Reversed in vitro by 4-AP	N-of-1 trials: seizure frequency increased in one patient with L298F; seizure control in another	3 other unique inherited variants on WES reanalysis: *CACNA1C* LoF*		Patient intolerant of prolonged ECG/EEG, ajmaline not possible. Relevance of *variant? Cause of increased seizures?

C

Focal-onset seizures to bilateral convulsions; no ID; family history	Treatment-resistant Normal high-resolution MRI Life-threatening and life-limiting seizures		Surgical resection as PM 	No benefit from surgery WGS reveals inherited *DEPDC5* stop gain variant	Trial of everolimus?	No trial data in *DEPDC5* epilepsy; young patient unwilling to try; regulatory hurdles

D

Brothers with severe epilepsy & ID; symptom onset age 7 years	Homozygous mutation identified in *GAMT* at age 26 years. First described 1996	Cerebral creatine metabolism disorder	Creatine supplementation	Seizures stopped, ASD withdrawn No RCT for this PM	Significant behavioural decline necessitates ASD reintroduction. Developmental component irreversible. PM treats seizures only.

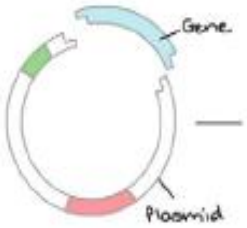
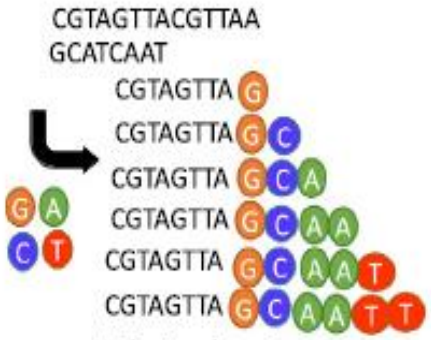
2. Cloning



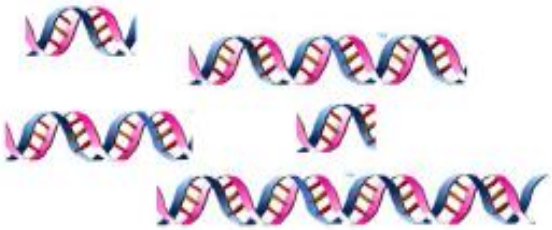
3. Cycle sequencing



4. Electrophoresis

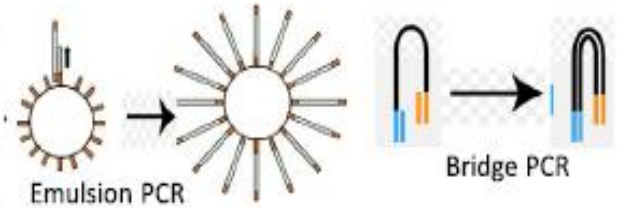
2nd Generation

1. Library preparation - DNA fragmentation



2. In vitro adapter ligation

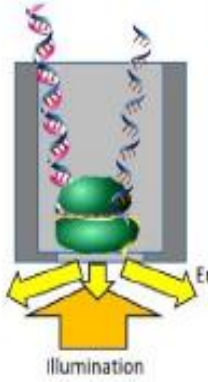
3. Clonal amplification



4. Cyclic array amplification

Pyrosequencing (454 sequencing)
Sequencing by ligation (SOLID platform)
Sequencing by synthesis (Solexa technology)
Reversible dye terminator (Illumina)

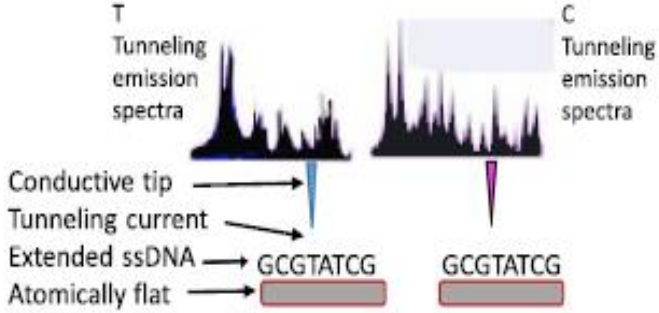
3rd Generation



1. Pacific biosciences

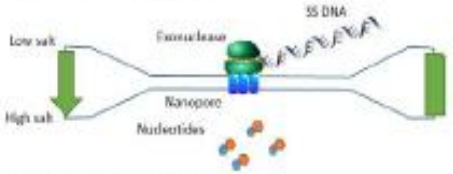
Fluorescence detection of gamma-labelled phosphonucleotides

2. Direct inspection



Oxford Nanopore

Translocation of nucleotides across a pore driven by ion concentration



IBM DNA Transistor

Individual bases are read as the ssDNA passes through the aperture based on the molecules unique electronic signature

Integrating Artificial Intelligence and Nanotechnology for Precision Cancer Medicine

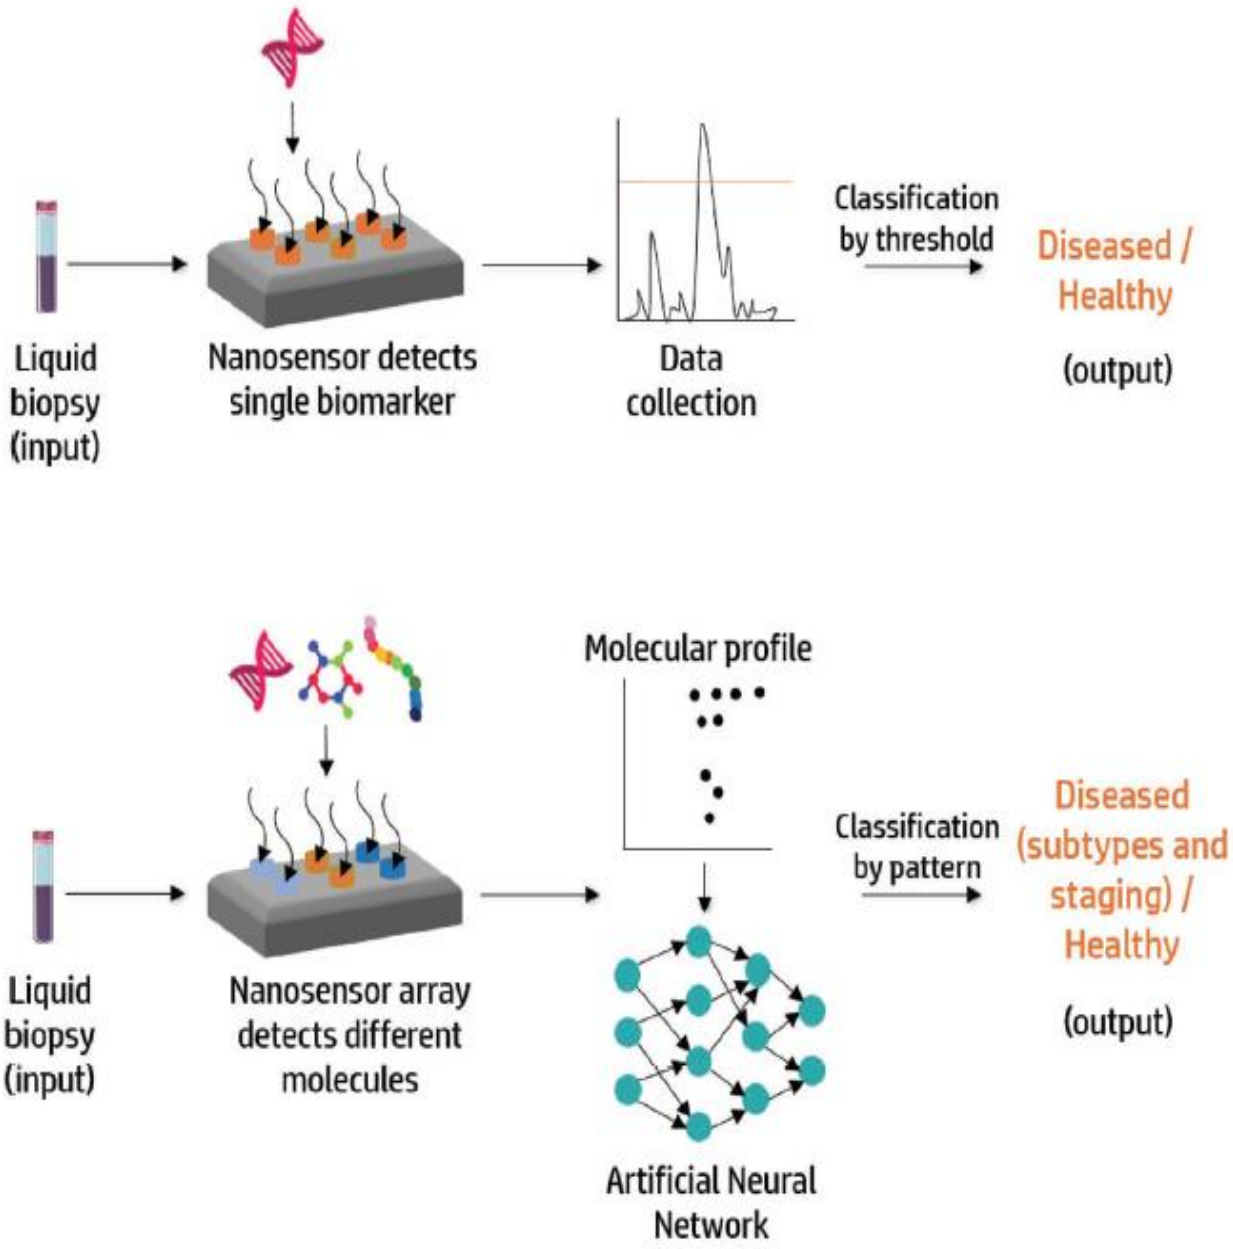
Single Biomarker Sensing

- High sensitivity and specificity in biomarker detection
- Dependence on discovery and approval of new biomarkers
- Inter-patient variability in biomarker concentrations limits the accuracy of the diagnostic prediction

Progress Towards Big Data Analysis

Multiplex Sensing

- Pattern-based analysis is not depended on a single biomarker
- Requires collection of large data sets for computing the classification pattern
- New approval procedures for pattern based diagnostics are required



Omer Adir et al Integrating Artificial Intelligence and Nanotechnology for Precision Cancer Medicine adma.2. Epub 2019 Jul 9.

Diagnostic test	Advantages	Disadvantages
Direct PCR	Simple Rapid Inexpensive Potential for quantitative PCR	Depends on hypothesis Requires primers that may not always work Limited to a very small portion of genome
Multiplex PCR	Rapid Able to detect multiple organisms	Low specificity and false positives for many organisms due to difficulty in quantitation Often requires more than one amplification Limited to a small portion of genome Requires primers that may not always work
Targeted universal multiplex PCR (e.g., 16S, ITS) for Sanger sequencing	Can differentiate multiple species within one pathogen type	Requires primers that may not always work Limited to a very small portion of genome
Targeted universal multiplex PCR (e.g., 16S, ITS) for NGS	Can differentiate multiple species within one pathogen type Multiplexing capability Potential for quantitation	Requires primers that may not always work Expensive and time consuming Often requires more than one amplification Limited to a very small portion of genome
Targeted NGS	Sensitive detection for selected organism types Potential for quantitation Potential to be combined with 16S NGS (see above)	Sequencing library preparation more complex, typically with more than one amplification Limited to a small portion of genome Expensive and time consuming Prone to contamination with environmental species
Metagenomic NGS	Hypothesis-free, or unbiased, testing Discovery of new or unexpected organisms Potential for quantitation Ability to detect any portion of genome	Must also sequence human host background Expensive Time consuming Not all genomes are available Prone to contamination with environmental species
Serology	Potential for diagnosis after acute infection Inexpensive	May be negative during early infection False-negatives in humoral immune deficiencies False-positives
Microscopy and staining (e.g., Gram stain, auramine–rhodamine, calcofluor-white)	Rapid Inexpensive	Low sensitivity unless there is a high burden of disease Low specificity
Culture	Able to accommodate large sample volumes Inexpensive Well studied	Sensitivity limited by use of antibiotics and antifungals Sensitivity limited for fastidious organisms Limited use in viral testing Long time to result, especially in acid-fast and fungal cultures
Matrix-assisted laser desorption/ionization time-of-flight mass spectrometry	High specificity Rapid after culture	Requires culture-positive isolate

Abbreviations: ITS, internal transcribed spacer; NGS, next-generation sequencing; PCR, polymerase chain reaction.

Cours de Génétique Médicale

1ère année médecin 2023 / 2024

Faculté de médecine et de Pharmacie d'Errachidia

1. Les acides nucléiques et Génome Humain
2. Réplication et systèmes de réparation de l'ADN
3. Transcription
4. Traduction
5. Contrôle de l'expression génique
6. Cytogénétique classique et moléculaire
7. Types et mécanismes des anomalies chromosomiques
8. Techniques d'analyse de l'ADN
9. Mutations et leurs conséquences en pathologie humaine
10. Mode de transmission des Maladies héréditaires
